LETTER OF TRANSMITTAL.

AUSTIN, TEXAS, December, 1902.

Hon. Wm. L. Prather, President, The University of Texas.

SIR: I beg to transmit, herewith, a report on "The Minerals and Mineral Localities of Texas," prepared by Dr. Frederic W. Simonds, Professor of Geology in the University. It will form Bulletin No. 5 of The University of Texas Mineral Survey.

In view of the deep interest now being shown in the mineral resources of the State, we have thought it advisable to issue a special publication dealing with the minerals and mineral localities. Dr. Simonds has been engaged upon this work for some time, and it is believed that the list he now presents covers the entire field as well as can be done at present.

Very respectfully,

WM. B. PHILLIPS.

Director.

INTRODUCTION.

There has been, so far as I am aware, no attempt to list, in a complete form, the mineral species occurring in Texas. In the "Mineral Resources of the United States" for 1882 (United States Geological Survey; Washington, 1883), Professor John C. Smock, of the Geological Survey of New Jersey, who was charged with the preparation of the material illustrative of the "Eastern Division," published two tables for the purpose of showing the mineral resources of Texas. The first included "Ores, minerals, and mineral substances, which are at present mined," and the second "Ores, minerals, and mineral substances of industrial importance and known occurrence, but which are not at present mined." Of the former, eight are mentioned, of the latter, thirty-two (pp. 733-736). In the "Mineral Resources" for 1887 (Washington: 1888), the same tables, with slight modification, mainly in the matter of additional localities, are repeated (pp. 792-794).

In the First Annual Report of the Geological Survey of Texas (Austin: 1890) Mr. W. H. von Streeruwitz published a list of minerals, sixty-three in number, observed in the Trans-Pecos Region, but the details of occurrence were not given (pp. 225-226).

In the same volume Dr. Theo. B. Comstock records one hundred and eleven minerals collected in the "Central Mineral Region"—the Llano Country. This "includes only those which occur as crystals or in special or rare situations," and is regarded by the author not as complete, but as affording a "preliminary list of localities" (pp. 379-391).

A "list of those minerals and rocks of Trans-Pecos Texas which up to this time could be classified by their appearance, blowpipe tests, and laboratory work," constitutes Chapter IV of a "Report of the Geology and Mineral Resources of Trans-Pecos Texas" by W. H. von Streeruwitz (Second Annual Report of the Geological Survey of Texas, 1890, pp. 710-713). It is, as the author states, "far from being complete, but it comprises a number of the more important and valuable minerals, building stones and ores of West Texas, giving the localities where they are found."

In his Second Annual Report as State Geologist, Mr. E. T. Dumble published a valuable statement of the "Mineral Resources of Texas," based, as he says, for the greater part upon the work of himself and his associates (Second Annual Report of the Geological Survey of Texas, p. 35, et seq.). This I have found very helpful in the preparation of the following list.

Unfortunately the State does not possess a collection of all the minerals enumerated herewith, consequently the information concerning them has been in large measure derived from many sources, viz., from a careful examination of the various reports relating to the geology of the State, keeping in mind at all times the value, so far as it could be estimated, of the observer as an authority. On the same basis the various

scientific journals have been examined and the transactions of the different learned societies. It is especially due that mention should be made of the *American Journal of Science*, the *Engineering and Mining Journal* (January, 1887-June, 1902), the *Transactions of the Texas Academy of Science* and the *Bulletins of the University of Texas Mineral Survey*. Nor should I omit the valuable publications of the United States Geological Survey, especially the volumes upon the "Mineral Resources of the United States," and of the *Engineering and Mining Journal*, entitled "The Mineral Industry." In some instances minerals or their localities have been inserted upon the statement of individuals, or as announced in the public press, but always with care.

In preparing the list I have, for convenience, arranged it alphabetically, my aim being to make it useful to the student, the prospector and the citizen. The name of the mineral species is first given, and, when possible, this is followed by the common name or synonym in general use, or both, together with the chemical name and formula. Following this list there is given a summary of the minerals of the State by counties.

As supplementing the necessarily brief mineral descriptions, those interested in the subject are referred to some standard work on mineralogy, such as "Dana's Manual of Mineralogy and Petrography" (elementary) or "Dana's Text Book of Mineralogy" (advanced), from which much of the descriptive matter in the following pages has been taken.

In compiling a work of this character one is, to a great degree, dependent upon the contributions of others, and so large has my indebtedness become that individual acknowledgments are well nigh impossible. As an exception, however, I would state that I have made free use of Dr. Comstock's "List of Minerals Collected by the Survey from the Central Mineral Region," before mentioned, as a base upon which to build this enlarged list of the "Minerals and Mineral Localities of Texas."

FREDERIC W. SIMONDS.

School of Geology, University of Texas, November 1, 1902.

Minerals from localities marked C are in the collection at the University.

Localities in Comstock's List are marked *.

Localities in von Streeruwitz's Lists are marked **.

U. T. M. S.—The University of Texas Mineral Survey.

H.—Hardness.

G.—Specific Gravity.

THE MINERALS AND MINERAL LOCALITIES OF TEXAS.

ACTINOLITE. *Calcium-magnesium-iron Amphibole.* $\text{Ca (Mg, Fe)}_3 (\text{Si O}_4)_3$.

A fibrous, bladed, columnar, or granular massive, light green mineral. Specific Gravity, 3-3.2. Hardness, 5-6.

BURNET COUNTY:

White Eagle Mine, five miles west of Burnet.

LLANO COUNTY:

King Mountains.*

Riley Mountains.*

Near Click, Glen and Sandy Gaps.*

ADULARIA. *A variety of Orthoclase. Potassium silicate,* pure or impure.

A white or "colorless subtransparent feldspar." Specific Gravity, 6.57. Hardness, 6.

LLANO COUNTY:

Barringer Hill.*

King Mountains.*

Cold Creek, near county line.*

Kothman's Water Gap.*

MASON COUNTY:

Martin Creek.*

AGATE. *Variegated Chalcedony. A variety of Quartz.* Si O_2 .

Three forms: 1. Banded with different colors as white, brown and blue. 2. Clouded. 3. Moss Agate, with dendritic inclusions of manganese oxide. Specific Gravity, 2.65-2.66. Hardness, 7.

BREWSTER COUNTY:

Chisos Mountains. C.

BURNET COUNTY:

Spring Creek.*

MCCULLOCH COUNTY:*

Banded Chert and Flint.

PECOS COUNTY:

West of Glass Mountains.

PRESIDIO COUNTY:

Abundant between Marfa and Chinati Mountains.**C.

"Agates can be gathered by the wagon load between the Davis and Chinati Mountains. They are the milky, cloudy, and banded varieties, from the size of peas to six, eight and occasionally even more inches in diameter, and might be cut into marbles, ornamental work, and mortars for chemical laboratories."—Von Streeruwitz.

SAN PATRICIO COUNTY:

Moss Agates in the vicinity of Mathis; not abundant.

SAN SABA COUNTY:*

Banded Chert and Flint.

ALABASTER. See Gypsum.

ALBITE. *Soda Feldspar. Aluminum-sodium Silicate.* $\text{Na}_2\text{O. Al}_2\text{O}_3. 6\text{Si O}_2$.

One of the triclinic Feldspars. Thick tabular crystalline, granular massive, or lamellar. White, often bluish or gray, opalescent, also tinted at times with green or red. Specific Gravity, 2.62-2.65. Hardness, 6-6.5.

BURNET COUNTY:

Clear Creek.*
Spring Creek.*

LLANO COUNTY:

Barringer Hill.*

"Albite is rare and occurs coating small cavities in the massive orthoclase. Crystals not above 1 inch in diameter were observed."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, p. 476. King Mountains.*

Little Llano Creek below Lone Grove.*

ALLANITE. *Orthite. Composition complicated. A Silicate of Aluminum, Calcium, Iron and the rarer metals.*

A brittle brownish-black mineral with a resinous or submetallic lustre. Crystals, tabular or elongated, sometimes so elongated as to become acicular. Massive and in grains. Specific Gravity, 3-4.2. Hardness, 5.5-6.

LLANO COUNTY:

Mexican Diggings, Babyhead Creek.*
Barringer Hill, C.

"Allanite has not yet been found very abundantly at this locality, and all of the ten kilos obtained was massive-nodular in form. Its surface alteration is very slight compared with that of the other allied minerals. Its color is shining pitchy-black. Powder and streak dull greenish-brown. Upon ignition it first turns red-brown, and then becomes coal-black. It is opaque, except in the very thinnest splinters, when a greenish-brown translucence is evident. Specific gravity = 3.488. We have made no complete analysis as yet, but the specimen tested showed the presence of considerable quantities of the cerium-yttrium earths and of thoria, and we learned that it was completely soluble in acids with the separation of gelatinous silica, either before or after igniting the mineral (like the associated gadolinite). The better masses have been found quite isolated from the other occurring minerals."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, p. 485.

Analyse des Allanits (von Llano County, in Texas).

Si O ₂	29.21
Fe ₂ O ₃	30.33
Gesammtceriterden	25.06*
Al ₂ O ₃	12.20
Ca O	3.69
	100.49

*(Nd₂ O₃, 4.76; Pr₂ O₃, 2.31; La₂ O₃, Ce₂ O₃.)

[Mittheilung aus dem chemischen Laboratorium der kgl. Akademie der Wissenschaften zu München.] Berichte der Deutschen Chemischen Gesellschaft, 32, Bd. III, S. 2677. 1899. Berlin: 1900.

ALAMANDITE. *Iron-aluminum Garnet.* $3 \text{ Fe O. Al}_2\text{O}_3. 3\text{Si O}_2.$

This species includes in part that which has been termed "common garnet" and in part that termed "precious garnet." Its color ranges from brownish red to black. Precious garnet is transparent. Specific Gravity, 3.9-4.2. Hardness, 6.5-7.5.

BURNET COUNTY:

Clear Creek.*C.

"Near Shannon's Quarries in great variety of colors."*

LLANO COUNTY:

Mexican Diggings, Babyhead Creek.*

ALUM. *Hydrous Aluminum Sulphate.*

PRESIDIO COUNTY:

Fresno Cañon.

AMAZON STONE. *See Microcline.*

AMETHYST. *Amethystine Quartz. Silica. Si O₂.*

A violet or purple variety of Quartz. Specific Gravity, 2.65-2.66. Hardness, 7.

BURNET COUNTY:

In granite. C.

EL PASO COUNTY:

Sierra Blanca. C.

LLANO COUNTY:

In granite.

AMPHIBOLE. *Hornblende. Magnesium-calcium-iron-aluminum Silicate.*

The colors of this mineral range usually through various shades of green, especially dark green, to black. Specific Gravity, 2.9-3.4. Hardness, 5-6.

BURNET COUNTY:

White Eagle Mine, five miles west of Burnet.

EL PASO COUNTY:

"Hornblende is found in the northern part of the Quitman Mountains, in the Sierra Carrizo, at the Rattle Snake tank, in a spur of the Van Horn Mountains, and in the Sierra Blanca group and its northwestern extension."—Von Streeruwitz.**

LLANO COUNTY:

Headwaters of Cold Creek.*

Riley Mountain.*

Near Click, Glen and Sandy Gaps.*

ANDRADITE. *Common Garnet, Black Garnet. Calcium-iron Garnet.* $3\text{Ca O. Fe}_2\text{O}_3. 3\text{Si O}_2.$

Of various colors: yellow in different shades, green and greenish yellow, dark green, brown, brownish red or yellow, gray-black, black. Specific Gravity, 3.8-3.9. Hardness, 6.5-7.5.

LLANO COUNTY:

Babyhead Mountain.*
Babyhead Creek.*

MASON COUNTY:

Kothmann Tract, three miles southeast of Spiller Mine.

"Two specimens of this variety of garnet from the Kothmann tract, fifteen miles northeast of the town of Mason, Mason county, have been analyzed. Both specimens are impure, as is shown by their physical features and by their variation from the true garnet ratio, but they probably approach the latter closely enough to be classed as garnets. It has been suggested by Dr. S. L. Penfield, who has kindly examined these analyses, that the minerals represent manganese varieties of andradite, which is a calcium-iron-garnet having the formula $\text{Ca}_3\text{Fe}_2\text{Si}_3\text{O}_{12}$, and that they bear a resemblance to the variety from Franklin, New Jersey, called Polyadelphite by Thompson. * * *

"The following analyses of the Texas specimens, made by R. N. Brackett, were not intended to be complete, but they show the important constituents of the minerals. They were made of material dried at 110°-115° Centigrade:

"(a) This is a massive or semi-crystalline mineral; color, chocolate-brown; streak, light brown; lustre, resinous; translucent; fracture, uneven; hardness, 7-7.5; specific gravity, 3.57. The mineral fuses readily into a black glass; is only slightly attacked by hydrochloric acid in the fresh state, but is readily decomposed with the separation of silica after fusion; with fluxes it gives manganese reactions.

Analysis of Andradite from Mason County, Texas.

—R. A. F. Penrose, Jr., Annual Report of the Geological Survey of Arkansas for 1890, Vol. I, pp. 435, 436.

ANKERITE. *Calcium-magnesium-ferrous Carbonate.*

Crystalline (rhombohedral), crystalline granular or compact. White to gray in color or reddish. Specific Gravity, 2.95-3.1.

BURNET COUNTY:
Spring Creek.*
High Point.*

LLANO COUNTY:
Northwest of Long Mountain, near Sutton's.*

ANTIMONY. *A Native Element. Sb.*

EL PASO COUNTY:**

"Antimony is contained in the ores of the Quitman Mountains and the Sierra Diablo."—Von Streeruwitz.

APATITE. *Calcium Phosphate.*

Crystallizes in hexagonal prisms; sometimes short and tabular. Occurs also in reniform masses having fibrous structure; massive, granular to compact. Color green, blue, white; sometimes yellow, gray, etc. Streak white. Specific Gravity, 3.17-3.23. Hardness, 5.

BURNET COUNTY:
High Point.*
Opposite Long Mountain (small green crystals in quartz).*

LLANO COUNTY:
Packsaddle Mountain (Cambrian).*

ARAGONITE. *Calcium Carbonate. Ca CO₃.*

Of various shapes—stalactitic, incrusting, globular, reniform, columnar, fibrous, etc.; crystals often acicular in radiating groups, also twinning. Color white, gray, yellow, green, etc. Streak uncolored. Specific Gravity, 2.93-2.95. Hardness, 3.5-4.

BREWSTER COUNTY:
Terlingua. C.

EL PASO COUNTY:
Franklin Mountains. C.

GILLESPIE COUNTY:
Southeast of Enchanted Rock.*

LLANO COUNTY:
South of Llano.*

MASON COUNTY:
Caylor's Diggings.*

SAN SABA COUNTY:
Quarter mile northeast of Barton's.*
Hinton Creek.*

WILLIAMSON COUNTY. C.
TRANS-PECOS REGION.**

ARGENTITE. *Silver Glance. Silver Sulphide. Ag₂ S.*

Metallic; of a blackish lead-gray color and streak. Octahedral crys-

tals often in reticulated or arborescent forms. Sometimes filiform; massive. Specific Gravity, 7.20-7.36. Hardness, 2-2.5.

TRANS-PECOS TEXAS.**

EL PASO COUNTY:

Hazel Mine, Sierra Diablo. C.

ASBESTUS. *A form of Amphibole.*

Fibrous. Of a white, green, or brown color.

GILLESPIE COUNTY:

Rare.*

LLANO COUNTY:

Near Sandys—not abundant.

ASPHALTUM. *Asphalt. Mineral Pitch. A Mixture of different Hydrocarbons.*

Color black, brownish black. Lustre pitch-like. Easily melted. Graduates by degrees to petroleum, from which, in many instances, it has been derived by the evaporation of the more volatile ingredients.

ANDERSON COUNTY:

"At a distance of from ten to twelve and a half miles northeast of Palestine there is a deposit of a partially consolidated sandstone which is in many places impregnated with an oily or asphaltic residuum. The material seems to be more abundant in the sandstone making up part of the ridge between Still's and Squirrel Creeks. The asphaltic sand outcrops in the creek banks, and has been encountered in practically all the wells dug in the neighborhood. It has been asserted that the deposits are in some instances more than forty feet thick, in which case the asphaltic material must impregnate more than one stratum. Nor is this at all unlikely, considering the nature of the beds making up the section."—Bull. of the Univ. of Texas Min. Surv., No. 3, p. 86.

—Bull. Univ. of Texas Min. Surv., No. 3, p. 81.

NACOGDOCHES COUNTY:
Reported.

PANOLA COUNTY:
Near Tatum.

PECOS COUNTY:
Northeast of Fort Stockton fifteen miles. Asphaltic Limestone.

SAN AUGUSTINE COUNTY:
Reported.

STEPHENS COUNTY:
Near Crystal Falls. Asphaltic Sandstone.

TRAVIS COUNTY:
Near Watter's Station, north of Austin. (See Petroleum.)

UVALDE COUNTY:

Carbondale, six miles southeast of Cline. Bituminous Limestone. Turkey Creek. C.

"The statement has been made (Mineral Resources of the United States, 1893, p. 637) that the rock contains from 15 to 33 per cent. of bitumen, and that the average was about 20 per cent. Numerous samples of this rock have been examined in the laboratory of the Survey, but we have not been able to confirm this statement. In an excellent paper on 'The Asphalt Deposits of Western Texas,' by Mr. T. Wayland Vaughan (Mineral Resources of the United States, 1896-1897), there are two analyses of this rock, given on the authority of Mr. R. T. Rokeby, vice-president of the Litho-Carbon Rubber Company, in which the total bitumen is placed at 25.18 per cent. and 9.03 per cent., but Mr. Rokeby says that the average of the rock mined is from 15 to 16 per cent. of total bitumen.

"The average of many analyses of this rock shows that it contains from 14 to 17 per cent. of total bitumen, *i. e.*, asphaltene plus petroleum, with 80-85 per cent. of carbonate of lime, with some iron and alumina, a very small percentage of silica, and sulphur up to one per cent."—Bull. Univ. of Texas Min. Surv., No. 3, pp. 92-93.

Smyth-Nunn Ranch, twelve miles southeast of Cline. Bituminous limestone carrying some silica.

Mays's Ranch, Waxy Falls, thirteen miles southwest of Uvalde. Calcareous bituminous sandstone. C.

ATACAMITE. *Hydrous Copper Chloride*. $\text{Cu Cl}_2 \cdot 3\text{Cu}(\text{OH})_2$.

Crystals slender and prismatic; striated vertically. Fibrous, granular, massive; sometimes as sand. Color: various shades of green. Streak, apple green. Lustre, adamantine; vitreous. Specific Gravity, 3.75-3.77. Hardness, 3-3.5.

TRANS-PECOS REGION.**

AVENTURINE. *A form of Quartz*, Si O_2 , bespangled with scales of mica, hematite or other mineral. See Quartz.

EL PASO COUNTY:

Quitman Mountains.**

AZURITE. *Blue Copper Carbonate*. *Hydrous Copper Carbonate*. *Basic Cupric Carbonate*. $2\text{Cu CO}_3 \cdot \text{Cu}(\text{OH})_2$, or $3\text{CuO} \cdot 2\text{CO}_2 \cdot \text{H}_2\text{O}$.

In short, thick, oblique, rhombic prisms; columnar, massive, stalactitic. Color blue, azure blue, Berlin blue. Streak blue. Vitreous lustre. Brittle. Specific Gravity, 3.77-3.83. Hardness, 3.5-4.

BURNET COUNTY:

White Eagle Mine, five miles west of Burnet.

EL PASO COUNTY:

Sierra Diablo, Bromide Mine. C.

Sancho Panza Mine. C.

Carrizo Mountains. C.

LLANO COUNTY:

McGehee Place, head of Little Llano Creek.*

Parkhill Ranch, four miles north of Llano.

Mexican Diggings, Babyhead Creek.*

Miller's Mine.*

Babyhead Mountain. C.

Pecan Creek. C.

Near Yoakum Creek (granite with malachite and azurite).*

TRANS-PECOS REGION.**

BARITE. *Heavy Spar. Barytes. Barium Sulphate.* Ba SO_4 .

Crystals tabular or prismatic. When massive often lamellar with convergent or curved plates. Also fibrous, columnar, granular, compact. Of a white color tinted with yellow, brown, red, blue. Lustre vitreous or pearly. Specific Gravity, 4.3-4.6. Hardness, 2.5-3.5. Brittle.

LLANO COUNTY. C.

BAT GUANO. Of economic importance but not strictly within the province of descriptive mineralogy. Found in caves. See article by Wm. B. Phillips in *Mines and Minerals*, Scanton, Pa., May, 1901.

BEXAR COUNTY.

BLANCO COUNTY.

BURNET COUNTY.

Headwaters of Beaver Creek.

COMAL COUNTY.

EDWARDS COUNTY.

GILLESPIE COUNTY.

HAYS COUNTY.

LAMPASAS COUNTY.

LLANO COUNTY.

SHELBY COUNTY.

TRAVIS COUNTY.

UVALDE COUNTY.

WILLIAMSON COUNTY.

BEAUXITE. *Bauxite. Hydrous Aluminum Oxide.* $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$.

Resembling clay, massive, oolitic. In color whitish, gray, yellow, brown. Specific Gravity, 2.55.

Fe_2O_3 may be present, either replacing some of the Al_2O_3 , or as an impurity. Si O_2 and other substances may also be present as impurities. See *Wocheinite*.

BURNET COUNTY:

Silver Mine Hollow, Beaver Creek.*

LLANO COUNTY:

King Mountains.*

Little Llano Creek, seven miles above Lone Grove.*

Near Smoothing Iron Mountain.*

Near Sutton's, northwest of Long Mountain, in quartz.*

Near head of Cold Creek.*

Near Field Creek.*

MASON COUNTY:

Little Bluff Creek.*

North of Mason Mountain.*

MCCULLOCH COUNTY:

East and west of Voca.*

San Saba River at crossing of Camp San Saba and Voca road.*

BERYL. *Aluminum-beryllium Silicate.* $3\text{Be O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{Si O}_2$.

Long hexagonal prisms, usually striated vertically. Columnar, granular, massive. Various shades of green, from emerald green to blue-

green, blue, yellow, white. Brittle. Streak white. Specific Gravity, 2.63-2.80. Hardness, 7.5-8.

GILLESPIE COUNTY:*

Crab Apple Creek. C.
West of Mt. Nebo. C.

LLANO COUNTY:

Not common.

"Some very large beryls have been found in Gillespie county and occasionally in Llano county. They occur in Archæan situations similar to those in which garnets abound."—Comstock.

BIOTITE. *A Magnesium-iron Mica.* Composition varying. Typical Biotite $(\text{H,K})_2(\text{Mg,Fe})_2\text{Al}_2(\text{Si O}_4)_3$.

Crystals rhombic or hexagonal prisms, not common. Usually found in scales or in masses composed of scales. Color green to black, brown, yellow, rarely white. Splendent lustre. Specific Gravity, 2.7-3.1. Hardness, 2.5-3.

BURNET COUNTY:

In granite, Granite Mountain.
Clear Creek.*
Near Spring Creek.*
Shannon's Quarries.*
White Eagle Copper Mine, five miles west of Burnet.

LLANO COUNTY:

Barringer Hill.*
Johnson Creek.*
King Mountain.*
Near Garner (?) Crossing of Llano River northwest of Gainsville (in graphic granite).*
Near Lone Grove.*
North of Lone Grove, Fisher and Miller Survey.*
North Sharp's Mountain (in granite).*
Miller's Mine.*
Rabb's Pasture.*
South of Field Creek, Panther Creek.*

MASON COUNTY:

Honey Creek, near Menardville road.*
North of Mason Mountain.*

MCCULLOCH COUNTY:

Southeast of Camp San Saba.*

BORNITE. *Purple Copper Ore. Variegated Copper Ore. Erubescite. Copper-iron Sulphide.* A sulphide of copper and iron in varying proportions. A typical form $3\text{Cu}_2\text{S} \cdot \text{Fe}_2\text{S}_3$.

Usually massive, granular, compact. Crystalline faces, when present, often rough or curved. Color copper-red to brown. Iridescent from tarnish. Streak grayish black. Brittle. Lustre metallic. Specific Gravity, 4.9-5.4. Hardness, 3.

EL PASO COUNTY:

LLANO COUNTY:

McGehee property, head of Little Llano Creek.*
Parkhill Ranch, four miles north of Llano.

BRAUNITE. $3\text{Mn}_2\text{O}_3 \cdot \text{Mn Si O}_3$.

Crystals octahedrons. Massive. Brown-black to steel-gray in color, and streak. Submetallic lustre. Brittle. Specific Gravity, 4.75-4.82. Hardness, 6-6.5.

LLANO COUNTY:

Chaney's Diggings, south of Packsaddle Mountain.*
Riley Mountain.*

BRICK CLAYS OR EARTHS.

Clays or earths that can be used in the manufacture of bricks are of common occurrence in the State. Excellent red brick are manufactured at many places. At Austin a light cream-colored brick, resembling the Milwaukee brick, is burned. The Quaternary clays of the Colorado Coal Field are said to be excellently adapted for brick-making. See also Pottery clays.

CHLORITE GROUP.

Silicates of a green color in which ferrous iron is a prominent ingredient. Closely related to the micas.

"Chemically considered, the chlorites are silicates of aluminum with ferrous iron and magnesium chemically combined with water. Ferric iron may be present replacing the aluminum in small amount; chromium enters similarly in some forms, which are then usually of a pink instead of the more common green color. Manganese replaces the ferrous iron in a few cases. Calcium and the alkalies—characteristic of all true micas—are conspicuously absent, or present only in small amount."—Dana's Text-Book of Mineralogy, New Ed., p. 472.

CHLORITE. *Hydrous Magnesium-ferrous-aluminum-silicate* is recorded as occurring in

GILLESPIE COUNTY:

South of Enchanted Rock.*

LLANO COUNTY:

Little Llano Creek.*

Honey Creek.*

CHLOROPAL. A *Hydrous-ferric Silicate*. Aluminum may be present. $\text{Fe}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot 5\text{H}_2\text{O}$.

Massive and opal-like, with conchoidal fracture, or earthy. Of a greenish yellow color. Specific Gravity, 1.72-1.87. Hardness, 2.5-4.5.

LLANO COUNTY:
Johnson's Creek.*

CHRISTOPHITE. A *variety of Sphalerite*. *Black Sphalerite*.

TRANS-PECOS REGION.**

CLAY IRON STONE. *Carbonate of Iron.* See Siderite.

CLAYS. See *Brick Clay, Fire Clay, Pottery Clay.*

COLUMBITE. *Iron-manganese-niobium-tantalate.* (Fe, Mn) (Nb, Ta)₂ O₆.

A black, brownish-black or grayish mineral. Often iridescent. Streak reddish to black. Lustre submetallic, subresinous, sometimes shining. Specific Gravity, 5-6. Hardness, 6-6.85.

LLANO COUNTY:

Barringer Hill. On the authority of Dr. Edgar Everhart.

COPPER, NATIVE. *An element.* Cu.

Often arborescent, filiform and wire-like. Also massive and in sheets. Crystals when present frequently distorted. Of a copper-red color. Hardness, 2.5-3. Specific Gravity, 8-8.9. Both ductile and malleable.

EL PASO COUNTY:

Hazel District, north of Van Horn.

COPPER ORES, PERMIAN.

"The existence of copper ores in the Permian measures of Texas has long been known, and these ores have been, from time to time, the object of geological researches and mining developments. * * *

"The ore appears principally in two zones of the Permian rocks, namely, the Red River zone in the counties of Archer, Wichita, Montague, Hardeman and Wilbarger, and the Brazos River zone in the counties of Haskell, Baylor, Stonewall and Knox. * * *

* * * * *

"The Permian copper-ores appear in several horizons, and there exist two such horizons in each of the above mentioned zones. In the Red River district, the lower horizon is reported near Belcher, in Montague county. It belongs to the lowest Permian, and lies not much above the line of contact with the underlying Coal-Measures. The upper horizon of the Red River district is represented in Archer and Wichita counties, etc.

"The lower copper-horizon of the Brazos River zone appears in the

counties of Haskell and Baylor, and the upper horizon in Stonewall county, etc.

* * * * *

“* * * The occurrences of copper-ores are scattered over a large area of Archer and Wichita counties, and the ore of Archer county appears principally in the marls and clay-slates as pseudomorph after wood (cuprified branches of trees, to a thickness of several inches in diameter), and as larger or smaller nodules (up to 4 or 6 inches in diameter), most or all of which are of fossiliferous origin.

“Copper-ore is found also in irregular amorphous masses, intermixed with and impregnating the marl and clay-slate. In a third form it occurs ‘as numerous small pebbles in a hardened cupriferous conglomerate.’ And, finally I found such nodules of copper-ore seated in hard clay-slate and even in sandstone.

“The copper-ore consists principally of green, blue and dark silicates and carbonates of highly varying percentage. The cuprified wood runs mostly high in copper, generally between 20 and 60 per cent., and the same is true of the nodules. When impregnating or intermixed with the clay and marl, the ore mostly contains less than 20 per cent. of copper; so does the conglomerate, etc.”—E. J. Schmitz, Trans. American Institute of Mining Engineers, Vol. 26, p. 97, *et seq.*, 1897.

CREDNERITE. *Copper-manganese Oxide*. Foliated. $3\text{Cu O} \cdot 2\text{Mn}_2\text{O}_3$.

Iron black to steel gray. Foliated. Metallic lustre. Streak black-brown. Specific Gravity, 4.9-5.1. Hardness, 4.5.

EL PASO COUNTY:

West of the Sierra Blanca.**

Hunter District, Quitman Mountains.**

CUPRITE. *Red Copper Ore*. Cu_2O .

Crystals in the form of octahedrons, cubes and dodecahedrons and their modifications. Massive, granular, earthy. Of a red color—sometimes dark. Streak brownish red of different shades. Specific Gravity, 5.85-6.15. Hardness, 3.5-4. Brittle; fracture conchoidal.

BURNET COUNTY:

White Eagle Mine, five miles west of Burnet.

TRANS-PECOS REGION.**

EL PASO COUNTY:

Boracho Mountains.**

Big Gulch District, Quitman Mountains.**

CUPRO-DESCLOISITE.

A massive variety of Descloisite in the form of crusts, reniform masses, etc., with 6.5-9 per cent of copper.

TRANS-PECOS REGION.**

CYANOTRICHITE. *Lettsomite*. $4\text{Cu O} \cdot \text{Al}_2\text{O}_3 \cdot \text{SO}_3 \cdot 8\text{H}_2\text{O}$.—Genth.

“Occurs in velvet-like druses of short capillary crystals; sometimes in spherical globules.”—Dana’s System. Color bright blue.

TRANS-PECOS REGION.**

CYPRINE. *A blue variety of Vesuvianite or Idocrase*, which with salt of phosphorus gives a copper reaction.

LLANO COUNTY:

"Babyhead Region (with idocrase and copper ore)."

CYRTOLITE. *Hydrous-zirconium Silicate*, often with uranium, yttrium, etc.

Crystals resembling rhombic dodecahedrons. Color brownish red. Lustre adamantine. Specific Gravity, 3.98-4.04. Hardness, 5.55.

LLANO COUNTY:

Barringer Hill.* C.

"Cyrtolite has been found abundantly in both massive form and in good crystallizations. One hundred kilos have thus far been collected while mining the yttria minerals. * * * This mineral here occurs in thick plates attached to the biotite and also constituting veins in the coarse pegmatite. It is often the matrix of the thoro-gummite and fergusonite. Specific gravity=3.652. It occurs in tetragonal forms with all the planes rounded, and polysynthetic groupings of crystals are very common. Its color ranges from dull gray, through various shades of brown to deep brown and almost black. Hardness about 5."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, pp. 485, 486.

At Hiram Castner's, 1 m. s.—Dana.

DIHYDRITE. *See Pseudomalachite.*

DOLOMITE. *Pearl Spar. Calcium Magnesium Carbonate.* $\text{Ca Mg C}_2\text{O}_6 = \text{Ca CO}_3. \text{Mg CO}_3.$

Crystallization rhombohedral. Curved faces common. Granular massive like marble. Of various colors from white to black, gray, reddish, brown, green. Lustre vitreous to pearly. Specific Gravity, 2.8-2.9. Hardness, 3.5-4.

CENTRAL MINERAL REGION:

"Very common as rock masses, occasionally crystalline, in the Silurian and Cambrian systems."—Comstock.

LLANO COUNTY:

Little Llano Creek.

TRANS-PECOS REGION.**

ENSTATITE. *Magnesium Silicate.* $\text{Mg Si O}_3 = \text{Mg O. Si O}_2.$

Crystals not common. Lamellar, also fibrous or massive. Color yellowish, greenish white, gray. Specific Gravity, 3.1-3.3. Hardness, 5.5. Brittle with an uneven fracture.

BURNET COUNTY:

Head of Clear Creek.*

LLANO COUNTY:

North Base of Long Mountain.*

EPIDOTE. *Pistacite. Hydrous Aluminum-ferrie-calcium Silicate.*

$\text{H Ca}_2 (\text{Al, Fe})_3 \text{Si}_3 \text{O}_{13} = \text{H}_2 \text{O. } 4\text{Ca O. } 3 (\text{Al, Fe}_3)_2 \text{O}_3. 6\text{Si O}_2.$

Crystals prismatic, passing into acicular and fibrous forms. Granular

massive. Color pistachio green (a peculiar yellowish green) varying from light to dark, the latter becoming black. Red and yellow forms are known and sometimes grayish white and colorless. Lustre vitreous. Specific Gravity, 3.25-3.5. Hardness, 6-7.

BURNET COUNTY:

At "Capitol Rock."
At Dupre's.—Dana.

LLANO COUNTY:

On Cherokee Road, one-half mile from Babyhead Postoffice.* C.

Flemming Postoffice.*
Near Fly Gap.*
One-half mile from Llano on branch of Oatman Creek.*

TRANS-PECOS REGION.**

EPSOMITE. *Epsom Salt. Hydrous Magnesium Sulphate.* $\text{Mg SO}_4 + 7\text{H}_2\text{O}$.

In masses and crusts and especially as efflorescences on rocks. With a bitter saline taste.

BROWN COUNTY:

Occurs in large quantities and of a purity sufficient to make it the source of an exceedingly cheap commercial product.

Analysis by Dr. H. W. Harper:

Water	40.07	40.00
Silica	21.075	21.43
Alumina and Iron Oxides.....	2.20	2.21
Magnesium Oxide	12.381	12.38
Calcium Oxide	trace	
Sulphur Trioxide	24.014	24.01
	99.74	100.03

Calculated to contain 76.13 per cent. MgSO_4 , 7 H_2O .

"A series of experiments demonstrated that the material yields crystallized MgSO_4 within one or two per cent. of the analytical results."—Dr. Henry Winston Harper, Trans. Texas Academy of Science, Vol. II, Pt. 2, pp. 91-92, 1899.

ESSONITE. See Grossularite.

FASSAITE. A variety of Augite.

"Includes the pale to dark, sometimes deep green crystals, or pistachio green and thus resembling epidote."—Dana.

BURNET COUNTY:

From well on branch of Spring Creek.*

FELDSPAR. See Orthoclase.

FELDSPAR, LABRADOR. See Labradorite.

FERGUSONITE. *Tyrite. Bragite.*

"Essentially a metaniobiate (and tantalate) of yttrium with erbium, cerium, uranium, etc., in varying amounts; also iron, calcium, etc."—Dana.

Fergusonite, mono-hydrated.—Specific gravity=5.67. Hardness, 6—6.5, form tetragonal, with acute octahedral terminations, a zirconoid plane hemihedrally developed and, rarely, the basal pinacoid. The crystals are rough and dull gray exteriorly, but with a bronzy sub-metallic appearance on the surface of fracture, which is small conchoidal and brilliant. Thin splinters show a yellowish-brown translucence. Color, bronzy hair-brown. Streak and powder dull brown. It is infusible, but on ignition the powdered mineral changes to a pale olive-green color, and a momentary glow creeps over the mass at the point of redness. Fragments decrepitate violently when heated. With a microscope a peculiar light brown muddiness is noticed, and the mineral is filled with minute streaks and spots of a darker shade, all of which may indicate incipient alteration.

"Crystals often have a thin coating of, or are otherwise partly altered to, the tri-hydrated variety next described. It is decomposed when in fine powder by hydrochloric acid, with separation of columbic acid. The analytical results are as follows:

Analysis.

			Oxygen ratio.
Ch ₂ O ₅	46.27%		86.30

LLANO COUNTY:
Barringer Hill.* C.

FERRO-CALCITE. A variety of *Calcite* containing Fe CO₃. *Calcium-iron Carbonate*.

BURNET COUNTY:
Silver Mine Hollow.*

LLANO COUNTY:
Little Llano Creek, near Lone Grove.*
Foot of Point Peak.*

FIBROLITE. *Sillimanite*. *Aluminum Silicate*. Al₂ O₃. Si O₂.

Crystals long and slender and often flattened rhombic prisms; also in fibrous masses. In color brown, grayish brown, or pale green. Lustre vitreous. Specific Gravity, 3.23-3.24. Hardness, 6-7.

BURNET COUNTY:
Garnet Diggings, Clear Creek.*

LLANO COUNTY:
Honey Creek.*

MASON COUNTY:
Head of Elm Creek.*

FIRE CLAY. A product of rock decay capable of resisting high temperatures.

FAYETTE COUNTY.

HARRISON COUNTY:
Marshall.

HENDERSON COUNTY:
Athens.

LIMESTONE COUNTY.
In general associated with coal. See Coal for localities.

FLINT. *A variety of Quartz.* SiO_2 .

In color gray, brown, brownish black, opalescent, pink. Lustre sub-vitreous. Fracture conchoidal—easily chipped, leaving a sharp edge.

CENTRAL MINERAL REGION:*

"In Silurian and Cretaceous limestones; somewhat common."—Comstock.

COMANCHE COUNTY:

"Opalescent with fossil nuclei."—Hill.

TRAVIS COUNTY:

Barton's Creek.

Taylor's Quarries, west of Austin.

Deep Eddy Bluff, on the Colorado.

"Where these chalky limestones form the mesas of extensive plateaus, such as the remnants of the Grand Prairie west and southwest of Austin, the flints are left in great quantities as a residuum (the softer chalk being more readily decomposed into soils and washed away), and they cover large areas of country."—R. T. Hill.

TRANS-PECOS REGION.**

FLUORITE. *Fluorspar.* *Calcium Fluoride.* Ca F_2 .

Crystals in the form of cubes, octahedrons, dodecahedrons, etc., with combinations. Cubes common. Also granular, coarse or fine, compact, massive. Of many colors—white, blue, green, yellow, red. The last not common. With a vitreous lustre and white streak.

BREWSTER COUNTY:

In association with cinnabar.

GILLESPIE COUNTY:

Near Enchanted Rock. C.

LLANO COUNTY:

Barringer Hill.*

"Fluorite occurs in some abundance. Masses of a pale greenish kind were found weighing fifty pounds tightly imbedded in the pegmatite. Purple and white shades have also been found. A very opaque dark purple kind has been found in small masses."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, p. 489.

FRANKLINITE. $(\text{Fe, Zn, Mn}) \text{O} \cdot (\text{Fe, Mn})_2 \text{O}_3$.

Crystals octahedrons or dodecahedrons, often modified so as to form grains. Granular massive, compact. Iron black. Reddish brown to black streak. Lustre metallic, at times dull. Specific Gravity, 5.07-5.22. Hardness, 6.5. Slightly affected by the magnet.

TRANS-PECOS REGION.**

GADOLINITE. $\text{Be}_2 \text{Fe Y}_2 \text{Si}_2 \text{O}_{10} = \text{Be}_2 \text{Fe (Y O)}_2 (\text{Si O}_4)_2$.

"Gadolinite. In the fall of the year 1888, Dr. A. E. Foote sent me for identification a shining black mineral from Burnet County, Texas*. A preliminary examination, which I made, proved it to be Gadolinite, which excepting that from Colorado, described and analyzed by Mr. L. G. Eakins of the U. S. Geological Survey, had never been observed in

*It is probable that Dr. Foote's specimens came from Llano county.

this country. Since it became known that the mineral brought from Texas by Dr. Foote was gadolinite, large quantities have been obtained, some in crystals, weighing from seven to eleven pounds. I am indebted to Mr. W. Earl Hidden for some from Llano County, Texas, and give in the following the results of my analyses of this, as well as that received from Dr. Foote.

"It has a black color; in thin splinters it is translucent with a dark bottle-green color; the fine powder is greenish-gray; fracture conchoidal to splintery. Specific gravity=4.201 (Burnet Co.) to 4.254 (Llano Co.)."

L. G. Eakins. (Analysis of Gadolinite from Llano County, Texas.)
See Hidden, W. E., and Mackintosh, J. B. A Description of Several
Yttria and Thoria Minerals from Llano County, Texas.

Amer. Jour. of Science, III, Vol. 38, pp. 474-486. December, 1889.

This analysis was privately communicated to the authors of the above
paper by Professor E. W. Clarke.

"History.—In July, 1886, the first piece of gadolinite (a mass of
about 1½ lbs.) was accidentally discovered, by Mr. J. J. Barringer, in
Llano County, Texas. It was noticed projecting from an outcropping
of granite and was detached therefrom and preserved merely because of
its peculiar appearance. Later Mr. Barringer commenced digging at
the locality, and in a short time unearthed a pocket of huge crystals and
masses of this rare mineral aggregating not less than 500 kilos. This
remarkable quantity was obtained by digging with a pick and shovel, in
the partly decomposed surface rock and all came from a space not over
4 feet deep, 3 feet wide and 8 feet long.

Until August, 1888, the true nature of the mineral remained unknown
and meanwhile it received such local names as 'tin ore,' 'black jack zinc,'
'volcanic-glass,' etc. Later the name 'samarските' was given to it and
as such it was known until Mr. Barringer, upon sending it to New York
in an endeavor to obtain a market for it, received the information that
it was gadolinite."

W. E. Hidden and J. B. Mackintosh, "A Description of Several Yttria
and Thoria Minerals from Llano County, Texas. *Amer. Jour. of Sci-*
ence, III, Vol. 38 p. 474, Dec. 1889.

The Brown Coals of Texas have been grouped as follows (Brown Coal and Lignite, by E. T. Dumble, Austin, 1892, p. 48 *et seq.*):

Lignite, Earthy Brown Coal, Brown Coal, Pitch Coal, Glimmer Coal.

In the following list of localities no attempt has been made to classify

the carbonaceous product, which, as will be seen from the terms above employed, varies from that in which the more or less altered vegetable matter may be readily recognized to that which in physical appearance most closely resembles true coal—black, massive, glossy, and having a subconchoidal fracture.

All of these varieties are assumed to be of the Tertiary Age.

FREESTONE COUNTY:

West of Fairfield.
Near Wortham. Borings show three seams. The second is said to have a thickness of five feet. See Dumble's Brown Coal and Lignite, p. 173.

FRIO COUNTY:

San Miguel Creek.

GONZALES COUNTY:

Near Guadalupe River, southeast and southwest of Gonzales.

GRAYSON COUNTY:

Near Gordonville.
One-half mile west of Martin's Springs. C.

GREGG COUNTY:

Near Centre, along Sabine River.

GRIMES COUNTY:

Northeast and west central parts; Bedias.

GUADALUPE COUNTY:

Northeast of Seguin.

HARRISON COUNTY:

Northeast part, near Caddo Lake.
Southern part, near Sabine River; Rocky Ford, seam four feet thick; near Carter's Ferry, six feet thick; Robertson's Ford, six feet thick.
West and northwestern parts.
Encountered in the Deep Well at Marshall. One hundred feet below the surface, seam one foot thick.

HENDERSON COUNTY:

West of Athens.
Northeast part.
Southern part.

HOPKINS COUNTY:

Como, ten miles east from Sulphur Springs. Seam seven feet one inch.—U. T. M. S.

HOUSTON COUNTY:

West of Crockett, near Trinity River.
East of Crockett, midway between Crockett and Lufkin.
Southwest part; Hyde's and Westmoreland's Bluff.
Wooter's Siding. Seam five feet six inches thick.—U. T. M. S.

JASPER COUNTY.

KARNES COUNTY:

Southwestern part.

LEE COUNTY:

Northwestern part; Blue Branch. C.
Giddings. Two seams, eighty feet below surface six feet thick; one hundred and twenty feet below surface four feet thick.
Rabb's Creek, below railroad Crossing.

LEON COUNTY:

Northern part; Bear Grass. Seam nine feet thick.
Northwestern part, near Jewett.
Southwestern part.
Southeast of Centreville.
On Trinity River, opposite Hyde's Bluff.

LIMESTONE COUNTY:

Southeast portion.
Head's Prairie.

MARION COUNTY:

East and west through central part; north of Caddo Lake.
Three seams were encountered in the Deep Well at Jefferson.

McMULLEN COUNTY:

Northern part.

MEDINA COUNTY:

Southeast of Castroville; Lytle Mine (near Lytle on I. & G. N. R. R.).
Seam five feet six inches thick.—U. T. M. S.

MILAM COUNTY:

Rockdale Mines. C. Seams six and a half, five and seven and a half
to eight feet thick.

Composition of Lignite (U. T. M. S.):

I.

BIG LUMP COAL COMPANY'S MINE.

Proximate Analysis—Natural Condition.

Moisture	31.52
Volatile and combustible matter	44.49
Fixed Carbon	17.48

—Bull. Univ. of Texas Min. Survey, No. 3, p. 51.

Along the Brazos.

Southeast of Cameron.

Northern part; Jones' Prairie.

MORRIS COUNTY:

Northern part, near Sulphur Fork.
Five or six miles south of Daingerfield.

NEWTON COUNTY.

PANOLA COUNTY:

Four miles south of Carthage.
North and northwest part; east of Tatum; northwest of Beckville.
Carter's Ferry.
Rocky Ford on the Sabine.
Mineral Springs. C.

RAINS COUNTY:

Southeast part.
Emery.
East of Emery seven miles.

ROBERTSON COUNTY:

Calvert Bluff Mines. Three seams, twelve, three and three feet thick.
Along the Brazos and Little Brazos Rivers.
North and northwest of Franklin.
East of Franklin on the Navasota River.
Northern part; Headville.
North of Hearne.
Southeast of Hearne, near the county line.

RUSK COUNTY:

Martin's Creek, north of Henderson.
Sulphur Spring.
Northeast of Henderson.
Millville.
Graham's Lake, twelve miles west of Henderson.
Southern part.

SABINE COUNTY:

Near county line, west of Hemphill.

SAN AUGUSTINE COUNTY.

SHELBY COUNTY:

Tandy Switch, one and one-half miles south of Timpson. Seam six feet six inches.—U. T. M. S.
South of Timpson seven miles. Five feet of Brown Coal.

SMITH COUNTY:

Southeast of Tyler.
Eight and a half miles west of Tyler. C.
Southwest of Tyler.
South of Tyler.
Near Lindale, northeast and west.
Of common occurrence in the county.

TITUS COUNTY.

TRINITY COUNTY:

Northern part.
Southwestern part.

UPSHUR COUNTY:

Western part.
Six miles northeast of Gilmer.

UVALDE COUNTY:

South of Uvalde fourteen miles; northern border of the San Tomas Field near Zavala county line.

VAN ZANDT COUNTY:

North half; near Grand Saline; north and northeast of Canton.
Southwest part.

WALKER COUNTY:

Northwest part.

WEBB COUNTY:

Western part.
San Tomas Mines. Seam two and a half feet thick.
Espada Creek, eight miles west of San Tomas.
Two and a half miles north of Palafox.
Northwest of San Tomas twenty-five miles.

"The coal of the San Tomas Field is hard, lustrous black, with a brown streak and a conchoidal fracture. No woody structure was apparent."—T. Wayland Vaughan, Bull, U. S. Geol. Surv, No. 164, p. 64.

WILSON COUNTY:

Southwest of Floresville.

WOOD COUNTY:

Southern part, along Sabine River; Mineola.

Alba Mines, near Alba. Seam eight feet six inches and nine feet.—

U. T. M. S.

“In this region there are three distinct deposits of brown coal. First, the upper bed cropping out close to the Alba Coal Company's shaft, a second one near Alba, and a third a short distance north of that village.”—E. T. Dumble, Rept. on Brown Coal and Lignite, p. 169. The upper seam is that above mentioned. Near Hawkins Station.

ZAVALA COUNTY:

Near north line of county on east bank of Nueces River. Two feet of coal exposed.

Southern part, between Turkey Creek and Nueces River.

(COMPLETE ANALYSES OF TEXAS LIGNITES ARE GIVEN IN BULL. NO. 3, UNIV. OF TEXAS MIN. SURVEY, MAY, 1902.)

LIMNITE. $\text{Fe}_2 \text{O}_3 \cdot 3\text{H}_2\text{O}$.

“A hydrated iron oxide, for the most part bog ore, recent in origin and containing organic acids with quartz sand, phosphoric acid, etc.”—Dana.

LLANO COUNTY:

Chaney's Diggings, Packsaddle Mountain (perhaps not correctly placed here).*

Long Mountain Region.*

Seven miles above Lone Grove, on Little Llano Creek.*

LIMONITE. *Brown Hematite. Hydrous Ferric Oxide.* $2\text{Fe}_2 \text{O}_3 + 3\text{H}_2\text{O}$.

In various forms: botryoidal, stalactitic, mamillary, massive, concretionary, earthy. Often shows a fibrous structure in the first mentioned forms. In color brown to ochre yellow, the latter in the earthy forms. Sometimes this mineral shows a bright black lustrous surface. Streak brown or yellowish. Specific Gravity, 3.6-4. Hardness, 5-5.5.

The Limonite Ores of East Texas have been classed as follows:

- (1) Brown Laminated Ores.
- (2) Nodular or Geode Ores.
- (3) Conglomerate Ores.

1. Brown Laminated. “This ore is a brown hematite of a rich chestnut color, and often of a highly resinous lustre. In structure it varies from a compact, massive variety showing no structure, to a highly laminated form, the laminae varying from one sixteenth inch to one-quarter inch thick, frequently separated by hollow spaces, and sometimes containing thin seams of gray clay. These often give it a buff color and a crumbly nature, and hence the name often applied to it of “Buff Crumbly Ore.” The laminae frequently show a black glossy surface.”

2. Nodular or Geode. “The ore is a brown hematite and occurs in a great variety of forms. It very rarely shows the laminated structure of the brown laminated ores or their resinous lustre. It generally occurs as nodules or geodes, or as honey-combed, botryoidal, stalactitic, and mammillary masses. It is rusty brown, yellow, dull red, or even black

in color, and has a glossy, dull, or earthy lustre. The most characteristic feature of the ore is the nodular or geode form in which it occurs. Some of the beds are made up of these masses, either loose or in a sandy clay matrix or solidified in a bed by a ferruginous cement. The ore lies horizontally at or near the tops of the hills, in the same manner as the brown laminated ores to the south of the Sabine River. The beds vary in thickness from less than one foot to over ten feet, the thicker ones being often interbedded with thin seams of sand."

3. Conglomerate. "The variety of ore included under this head consist of a conglomerate of brown ferruginous pebbles one-quarter to two inches in diameter and cemented in a sandy matrix. Sometimes a few silicious pebbles are also found. The beds vary from one to twenty feet thick, and are generally local deposits along the banks and bluffs and sometimes in the beds of almost all the creeks and streams in the iron ore regions * * *. They are generally of low grade, but could be concentrated by crushing and washing out the sandy matrix. They usually contain more or less ferruginous sandstone in lenticular deposits, and are much cross-bedded. These ores are seen throughout East Texas from the Red River to the Brazos."—R. A. F. Penrose, Jr., "Preliminary Report on the Gulf Tertiary of Texas." See First Ann. Rept. Geol. Survey of Texas, 1889.

"Throughout northeastern Texas we have an extensive series of iron ore deposits, occupying portions of 19 counties and having approximately an actual ore covered area of 1,000 square miles. The existence of these ores has long been known. The great ore belt may be described as a triangular area, bounded on the north by an irregular line drawn from the Sulphur Fork, in Cass County, extending west and south through Daingerfield, in Morris County, to a little south of Quitman, in Wood County. The western limitation of the belt extends irregularly southward through the west side of Smith, east side of Van Zandt and Henderson, and the center of Anderson County, a short distance west of Palestine, and in a southwesterly direction to the Brazos River, near Hearne. The southern side is limited to a line crossing the Trinity River, near Crockett, the Neches at Augusta, and the Sabine River near the northeast corner of Sabine County. The total area is approximately 10,000 square miles, of which about 1,000 square miles are covered with iron ore."—W. Kennedy. See *Engineering and Mining Journal* Vol. 57, p. 222. March 10, 1894.

TRANS-PECOS REGION.**

LITHOMARGE. *Compact Kaolinite, Indurated Kaolinite.*BURNET COUNTY:
High Point.*MACKINTOSHITE. *Silicate of Uranium, Thorium, Cerium, etc.—*
Dana.

"The mineral is opaque and black, but not quite so dull in lustre as the associated black cyrtolite which it resembles to a very remarkable degree. A strong lens is necessary to distinguish the two. Its hardness is about 5.5. No trace of cleavage has been observed. Its fracture is minute sub-conchoidal to hackly. Density=5.438 at 21° C. Its form, as is often evidenced by the thoro-gummite, is tetragonal and closely resembles zircon and thorite in habit and angle. Square prisms, sometimes 1 cm. thick, with a simple pyramid are all the forms thus far observed. It also occurs massive, nodular and filling veins in cyrtolite and fergusonite embedded in a coarse pegmatite. Under the blowpipe, it is infusible but becomes fissured in all directions without intumescence or decrepitation.

"In powder the mineral is not entirely decomposed by any one acid. Sulphuric acid attacks it quite strongly but the gelatinous silica set free protects it from further action. Hillebrand has observed, however, that if nitric acid is added, speedy and complete solution results."

William Earle Hidden. *Amer. Jour. of Science*, III, Vol 46, p. 99, 1893.

MANGANESE MINERALS.

See Andradite; Psilomelane; Pyrolusite; Spessartite; Tephroite; Wad.

"The manganese ores of Texas occur in the central part of the State, mostly in Mason, Llano and San Saba counties. The different deposits are from forty to sixty miles from railway transportation, and no ore has yet been shipped from any of them. Several places, however, have been prospected, especially the Spiller Mine and the Kothmann tract in Mason county, and, to a lesser degree, Horse Mountain, in Llano county.

"The ores are associated with quartzites and gneisses, though micaceous and garnetiferous schists are frequently found in the neighborhood. The rocks are much disturbed and dip at various angles, sometimes standing vertically. They are supposed to be of pre-Cambrian age.

"The manganese minerals of the Central Texas region occur in the forms of oxides and silicates. The latter, so far as yet determined, generally represent manganiferous varieties of garnet, though the protoxide silicate of manganese known as tephroite has also been found.

"The oxides of manganese occur in either a massive form or as a granular crystalline aggregate, the two being more or less intimately associated. The massive variety has a black color, a smooth conchoidal fracture, and a hardness of 6 to 7. The crystalline variety is black and often very soft, in which condition it represents pyrolusite. The oxides are generally associated with more or less silica, which sometimes amounts to from 15 to 25 per cent., and makes the true mineralogical nature of the ores doubtful. Dr. T. B. Comstock notes the existence of psilomelane, pyrolusite, and wad in the Central Texas region."—R. A. F. Penrose, Jr., Geol. Surv. of Arkansas, Rept. for 1890, Vol. 1, pp. 432-433.

"MODE OF OCCURRENCE OF MANGANESE ORES.

Both the oxides and the silicates of manganese occur, so far as observed, as lenticular layers in the quartzites and gneisses. They have not been seen anywhere to cut across the enclosing beds, but, on the contrary, appear to follow the strike of the country rocks throughout their folds. They are not confined to one kind of rock, but have been observed in at least two different associations: at the Spiller Mine they are in quartzite, while at the Kothmann property and on Horse Mountain they are in gneiss. Though the manganese deposits are probably lenticular, alternately thinning out and appearing

again beyond, they are often traceable for considerable distances, in some places for half a mile or more. They vary from a few inches to several feet in thickness and crop out along the summits and slopes of the mountains. They frequently contain lenticular strata of a similar nature to the enclosing rocks."—R. A. F. Penrose, Jr., *loc. cit.*, p. 441.

MARCASITE. *White Iron Pyrites. Iron Disulphide.* Fe S_2 .

See Pyrite.

MARGARITE. *Hydrous—aluminum—calcium Silicate.*

Foliated; with mica-like cleavage but brittle laminae. Color grayish, white, pink, reddish, yellow. Lustre pearly to vitreous. Specific Gravity, 2.99-3.08. Hardness, 3.5-4.5.

MERCURY. *Quicksilver. A Native Element.* Hg.

In bright metallic globules. Of a tin-white color. Specific Gravity, 13.596.

BREWSTER COUNTY:

Near Terlingua.

"Found in its native state filling cavities in the limestone and as globules in crevices of rocks impregnated with cinnabar,"—E. P. Spalding, *Engineering and Mining Journal*, Vol. 71, June 15, 1901, p. 750.

See also Bull. No. 4, Univ. Tex. Min. Surv., October, 1902.

METACINNABARITE. *Mercuric Sulphide.* Hg S. (See Cinnabar, which is of the same composition.)

"Occurs in black tetrahedral crystals; also massive." Specific Gravity, 7.8.

BREWSTER COUNTY:

Terlingua District in small amounts; amorphous.

METAGADOLINITE.

A mineral substance covering Gadolinite.

Original description:

"The material enveloping the Gadolinite seems to be amorphous; dull,

with an uneven fracture and brittle; its color is grayish brown; streak red, when powdered bright red.

"It was found necessary to float off the suspended part in water from another portion which was not decomposable by hydrochloric acid, and this was repeated until a sample was wholly decomposable by that acid. The silica did not gelatinize.

"Hardness=3. Sp. gr.=3.494.

"Not fusible before the blow-pipe. The fluxes indicated iron; heated in a tube it gave water. Heated with carb. soda upon charcoal it afforded a dark brown slag.

"The analysis indicated great complexity of mixture:

Si O ₂	18.145	per cent.	O= 9.676
Ce ₃ O ₄	20.662	per cent.	O=16.773
Fe ₂ O ₃	26.026	per cent.	O= 7.807
Y O	21.854	per cent.	O= 4.500
Ca O	3.642	per cent.	O= 1.040
Mg O	0.214	per cent.	O= 0.085
H ₂ O	9.761	per cent.	O= 8.676
*	*	*	*

"I am not aware that this material over the Gadolinite has been named. I propose for it the name *Metagadolinite*."

E. Goldsmith, Proc. Acad. of Nat. Sciences, Phila., May-Sept. 1889, p. 165.

LLANO COUNTY:
Barringer Hill.*

METEORIC IRON. *Native Iron found in Iron Meteorites and as grains or scales in Siderolites and Meteoric Stones.*

It is difficult to establish with precision the localities of the early discoveries of Meteoric Iron in Texas.

BOSQUE COUNTY:
Five or six miles southwest of Iredell.

"IREDELL METEORITE."

*Both variable with the distribution of schreibersite and troilite.

—*Amer. Jour. of Science*, III, Vol. 28, p. 287, 1884.

The larger part of this fall is in the collection of the University of Texas.

MICA. *See Biotite and Muscovite.*MICROCLINE. *Potash Feldspar. Green Variety*—*Amazon Stone.*

Resembles Orthoclase but the cleavage angle falls a few minutes short of 90°. Cleavage surface may be finely striated. Color white, red or green. Lustre vitreous to pearly. Specific Gravity, 2.54-2.57. Hardness, 6-6.5.

LLANO COUNTY:

Upper Ford of Llano River.*

MASON COUNTY:

Hermann Creek. C.

TRANS-PECOS REGION:

As float south of Pena Colorado."—Von Streeruwitz.

MOLYBDENITE. *Molybdenum Disulphide*. Mo S_2 .

Crystals hexagonal; tabular or prismatic. Usually in foliated masses resembling Graphite. Also in scales or granules. Color lead gray. Greasy. Specific Gravity, 4.7-4.8. Hardness, 1-1.5.

BURNET COUNTY:

In granite, Granite Mountain.

LLANO COUNTY:

Barringer Hill.*

"Molybdenite occurs sparingly in quite large folia, and in hexagonal tables, with cyrtolite and fergusonite."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, p. 485.

MOLYBDITE. *Molybdenum Trioxide*. Mo O_3 .

"In capillary tufted forms and earthy. Color straw-yellow."—Dana.

EL PASO COUNTY:

Sparingly north of Van Horn in Sierra Diablo."—Phillips.

LLANO COUNTY:

Barringer Hill.*

"Molybdite was noticed in the cavities once occupied by molybdenite and it often yet retained the plate-like form of the mineral from which it was derived by alteration. Its color was from white to greenish-white. Specific gravity=4.004. On two specimens indistinct crystals have been found, having a light apple-green color and almost perfect transparency. Qualitative tests have shown the absence of any large amounts of anything but molybdic acid."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, p. 485.

MUSCOVITE. *Potash Mica*. *Common Mica*. *Aluminum Potassium Silicate*. $\text{H}_2 \text{K Al}_3 (\text{Si O}_4)_3$.

Crystals tabular, usually six-sided. Commonly occurs in plates and scales. Laminae elastic. Color various: white (or colorless), gray, yellow, brown, and less frequently reddish, violet, greenish. Lustre vitreous (micaceous). Specific Gravity, 2.76-3. Hardness, 2.2-5. Transparent; translucent.

LLANO COUNTY:

Head of Rocky Creek, east of Riley Mountain.*

Mexican Diggings, Babyhead Mountain.*

Near Sandy Mountain Postoffice.*

Near Smoothing Iron Mountain.*

Little Llano Creek, below Lone Grove.*

North of Lone Grove.*

MASON COUNTY:

North of Fly Gap, on the road to Pontotoc.*

King Mountain. C.

MANY OTHER LOCALITIES.*

NICKEL.

EL PASO COUNTY:**

"Nickel exists in the ores of the Hunter and Quitman Mountains. Bona prospects, and probably with the material of most of the Quitman Mountain prospects."—Von Streeruwitz.

NITRE. *Saltpetre. Potassium Nitrate. KN O₃.*

In tufts, masses or incrustations. Cave deposits. White, gray, yellow.
Specific Gravity, 2. Hardness, 2.

EL PASO COUNTY:

North of Van Horn.—E. M. Skeats.

SAN SABA COUNTY.

NIVENITE. *A Variety of Uraninite. A Hydrated Thorium-Yttrium-Lead Uranate.*

"This mineral we found intimately associated with fergusonite and thorogummite. It is as yet a rare mineral at the locality. Its specific gravity is 8.01, H.=5.5. It is velvet-black in color, and when powdered becomes brown-black. After ignition it turns blue-black. As yet only massive pieces have been found, but some of these suggest that the species may be isometric in crystallization. It is easily soluble in nitric and sulphuric acid, and some slight effervescence was noticed upon dissolving the mineral. The analysis gave the following results:

		Oxygen Ratio.	
U O ₃	46.75		48.69=12.
U O ₂	19.89	14.62	} 37.33= 9.20
Th O ₂	7.57	5.74	
Y ₂ O ₃ etc.....	11.22	11.34	
Fe ₂ O ₃	0.58	1.08	
Pb O.....	10.16	4.55	} 14.11= 3.48
(Ignition) loss H ₂ O.....	2.54		
Insoluble.....	1.22

 West of King Mountain three miles. C.

PEARLS. Of economic interest but not strictly within the province of descriptive mineralogy.

Found in Unios, or Fresh Water Mussels in many of the streams of Texas.

"Of single pearls, one from Montpelier, Vt., valued at \$300; one from Waynesville, Ohio, valued at \$200; one from Boston, Texas, valued at \$250; one pink pearl, $19\frac{1}{2}$ grains, from Murfreesborough, Tenn., valued at \$80; and another at \$150; one from Llano, Texas, valued at \$95, have been sold in New York. G. F. Kunz, Gems and Precious Stones, 2nd Edition, p. 231. New York, 1892.

PENNINITE. *Pennine. Chlorite in part. Hydrous—magnesium—aluminum—ferric Silicate.*

Cleavage mica-like. Crystals tabular, steep rhombohedral or tapering six-sided pyramids. Occurs also in scaly masses or compact. Green in various shades, greenish red, pink, violet, yellow, white. Laminae flexible; inelastic. Specific Gravity, 2.6-2.85. Hardness, 2-2.5.

LLANO COUNTY:

Mexican Diggings, Babyhead Mountain,*

PETROLEUM. *Rock Oil. Mineral Oil.*

A complex native hydrocarbon compound, having a disagreeable odor, of colors varying from black to brown, brownish-yellow and greenish-brown. Some varieties are thin and flow readily, others thick and more or less viscid.

ANDERSON COUNTY:

New Palestine. Sand impregnation.

BASTROP COUNTY:

ROWLANDITE. *An Yttrium Silicate.*

"The mineral is isotropic, its hardness is 6, its fracture glassy conchoidal, its lustre vitreous-resinous and the powdered mineral is a light greenish gray. It is easily soluble in acids with gelatinization."

"Its color varies from bottle- to pale drab-green when pure and its lustre on a fractured surface is decidedly more vitreous than that of gadolinite. It is also more transparent, being perfectly so in thin splinters."—W. E. Hidden. *Amer. Jour. of Science*, III, Vol. 46, p. 209. Specific Gravity, 4.515.

"The specimen of Rowlandite, furnished by Mr. Hidden for analysis, was a portion of a mass resembling somewhat amorphous gadolinite. It had a glassy interior surrounded by an uneven thickness of reddish alteration substance, chiefly a carbonate, or carbonates, of the rare earths and lime. The glassy 'rowlandite' showed, when broken up, reddish and dark stains in places, the latter being produced by minute black inclusions, perhaps of a titanium mineral. Numerous scarcely visible fissures, filled with foreign matter, traversed the glass. This rendered the selection of pure material an arduous task; the result of several days of

labor, however, was a sample possessing a high degree of purity as shown by the microscope. A small amount of impurity was still present, but much less, apparently than the analysis seems to indicate. A slight cloudiness in some grains points to incipient change. Its density is the same as that found by Mr. Hidden, 4.513, at 15.5° C. The analysis is as follows:

			Mean.	
Silica (Si O ₂).....	25.77	26.04	26.04*

SPESSARTITE. *Spessartine. Manganese-Aluminum Garnet.*

"Specimen from Horse Mountain [five miles north of Llano], Llano County, Texas. This mineral is massive to crystalline; color pale lemon-yellow; streak light yellow; lustre resinous (dull in weathered specimens); translucent; fracture conchoidal to uneven; hardness 7. Its specific gravity as determined by R. N. Brackett is 3.79. It contains disseminated particles of magnetite and pockets and veins of transparent or smoky quartz. The mineral fuses to a black glass; is insoluble in hydrochloric acid in the fresh state, but after fusion rapidly decomposes with the separation of silica; with fluxes it gives manganese reactions.

"The survey is indebted to the kindness of Professor F. W. Clark, Chief Chemist of the United States Geological Survey, for the following analysis by Dr. W. H. Melville, whose examination has shown the mineral to be spessartite:

Analysis of Spessartite from Llano County, Texas.

	Per cent.	Ratio.	
Silica (Si O ₂).....	35.93	.600	3.00
Ferric oxide (Fe ₂ O ₃).....	4.60	.029	} .206 1.03
Alumina (Al ₂ O ₃).....	18.08	.177	
Manganese protoxide (Mn O).....	31.77	.449	} .618 3.09
Lime (Ca O).....	8.48	.152	
Baryta (Ba O).....	trace		
Magnesia (Mg O).....	0.69	.017	
Potash (K ₂ O) {			
Soda (Na ₂ O) {	0.17		
Phosphoric acid (P ₂ O ₅).....	none		
Titanic acid (Ti O ₂).....	trace		
Loss at 105° C.....	0.03		
Loss on ignition.....	0.36		
	100.11		

"In the sample taken for analysis the quartz was separated from the spessartite and the small amount of magnetite was removed by a magnet. 'A black oxide of manganese remained in the material analyzed, so that the quantity of ferrous oxide could not be determined. The iron was weighed as ferric oxide.'" R. A. F. Penrose, Jr., Ann. Rept. Geological Survey of Arkansas for 1890, pp. 433, 434.

TENGERITE. *Yttrium Carbonate?*

White coatings associated with gadolinite.

LLANO COUNTY:

Barringer Hill.*

"Tengerite(?)—In the cracks and fissures of the gadolinite and yttrialite a white mineral rich in CO_2 is often noticed. We have seen it in globular-radiated incrustations and in one instance in distinct transparent isolated crystals. Dr. Genth has already noted its

occurrence, and, as he observes, there is not enough now obtainable to show its composition except by qualitative tests."—Hidden and Mackintosh, *Amer. Jour. of Science*, III, Vol. 38, p. 486.

TEPHROITE. *A Protoxide Silicate of Manganese.* 2Mn O. Si O_2 .

"Specimen from the Kothmann tract [three miles southeast of the Spiller mine], Mason County, Texas. This mineral is massive; color gray or greenish-gray; streak white; lustre resinous; translucent; hardness, 6; very tough; specific gravity, 3.94. It is fusible, gelatinizes in hydrochloric acid, and with fluxes gives manganese reactions. It effervesces in hydrochloric acid, probably from the presence of a carbonate, as is shown in the analysis.

* * * it is much jointed and breaks into angular blocks. It is decomposed on the surface and along the joint cracks, giving rise to a black incrustation of oxide of manganese, enclosing an interior of unaltered mineral. The following analysis, made by W. A. Noyes, shows its composition:

Analysis of Tephroite from Mason County Texas.

Silica (Si O_2)	28.57
Ferric oxide ($\text{Fe}_2 \text{O}_3$)	5.52
Alumina ($\text{Al}_2 \text{O}_3$)	2.46
Manganese protoxide (Mn O)	58.86
Lime (Ca O)	0.30
Magnesia (Mg O)	0.80
Alkalies (as $\text{Na}_2 \text{O}$)	0.27
Carbonic acid (C O_2)	2.92

99.70

"It is evident from the analysis that the specimen is an impure material, but the composition approaches that of Tephroite, which is a protoxide of manganese having the formula 2Mn O. Si O_2 , and containing theoretically manganese protoxide 70.2 and silica 29.8. The sesquioxide of iron and the alumina do not normally belong in a protoxide silicate and are probably admixtures, due to the specimen being a massive material. The carbonic acid possibly exists as carbonate of manganese, which may have been formed by the alteration of the silicate."—R. A. F. Penrose Jr., Annual Report of the Geological Survey of Arkansas for 1890, Vol. I, pp. 436, 437.

THOROGUMMITE. *A Hydrated Uranium Thoro-Silicate.*

"This mineral, of which we have been able to gather about one kilo, occurs intimately associated with fergusonite and cyrtolite, and masses up to three ounces have been found, though for the most part it is in very small pieces. It is of a dull yellowish-brown color, has hardness above that of gummite, or 4-4.5, and occurs commonly massive, though several well defined groups of zircon-shaped crystals have been discovered with angles near to those of zircon. It has a characteristic color, after ignition, becoming of a dull greenish hue. Thus it is distinguished from freyalite, eucrasite and thorite, which species it otherwise resembles in some respects. Its specific gravity varies from 4.43 to 4.54. It is easily soluble in nitric acid. The analytical results are:

		Oxygen ratio.	
Si O ₂	13.085	43.62 =	2.000
U O ₃	22.43	23.37 =	1.071
Th O ₃	41.44		
Al ₂ O ₃	0.965	31.22 }	
Fe ₂ O ₃	0.845	2.83 }	
(Ce Y) ₂ O ₃ , etc.....	6.69	1.59 }	
Pb O.....	2.16	6.30 }	43.64 = 2.001
Ca O.....	0.41	0.97 }

Amorphous or earthy. Of a lemon or orange-yellow color.

EL PASO COUNTY:

- Hunter District, Quitman Mountains.**

URANPECHERZ. *See Pitchblende.*

VERMICULITE. *Hydrous-magnesium-aluminum-ferrous-silicate.*

A member of the so-called "Vermiculite Group," which includes a number of mica-like minerals, hydro-silicates, said to be alteration products of the micas.

According to Crossley (Dana, Min. 3rd Ed., p. 291, 1850), Vermiculite occurs in small foliated scales, distributed through a steatitic base, hence scaly-massive. H. 1-2 G.=2.756; lustre somewhat talc-like; color grayish, somewhat brownish.—Dana. Syst. Min., 6th Ed., p. 665.

LLANO COUNTY:

Mexican Diggings, Babyhead Mountain.*

VESUVIANITE. *Idocrase. Aluminum-calcium-magnesium-iron silicate. Formula uncertain.*

Crystals prismatic or pyramidal. Columnar, massive, granular. In color brown, green, yellow. Streak white. Lustre vitreous—resinous. Specific Gravity, 3.35-3.45. Hardness, 6.5.

BURNET COUNTY:

Garnet Diggings.*

"Clear Creek."—Dana.

LLANO COUNTY:

Barringer Hill.*

Babyhead Region.*

Ten miles west of Llano. C.

VOIGTITE.

A hydrated Biotite?

CENTRAL MINERAL REGION.

LLANO COUNTY.(?)

WAD. *Bog Manganese. Manganese Dioxide+Water mixed with oxide of Iron, etc.*

Massive or reniform, compact, earthy, encrusting. Black or brownish black. Specific Gravity, 3-4.26. Soft usually; sometimes 6 in Hardness.

EL PASO COUNTY:

In prospects west of the Sierra Blanca.**

Hunter District, Quitman Mountains.**

LLANO COUNTY:

Cold Creek.*

Babyhead Region.*

MASON COUNTY:

Spiller Mine, fifteen miles northeast of Mason.

SHELBY COUNTY:

"One mile south of Tenaha, in nodules, on line of H. E. & W. T. R. R."—J. B. Walker.

TRANS-PECOS REGION.**

WOCHEINITE. *A clay-like variety of Beauvite.*

Color gray, or if oxide of iron be present red.

LLANO COUNTY:

Yoakum Hollow, Little Llano Creek Region.*

WOLFRAMITE. *Wolfram. Tungstate of Iron and Manganese.*
(Fe, Mn) $W O_4$.

Crystals tabular or prismatic; prismatic faces vertically striated. Laminated, bladed, columnar, granular. Color grayish or brownish black. Specific Gravity, 7.2-7.5. Hardness, 5-5.5. Lustre submetallic. Brittle. May be slightly magnetic.

CENTRAL MINERAL REGION.*

EL PASO COUNTY:

With cassiterite (tin ore), ten miles north of El Paso.
North of Van Horn.

TRANS-PECOS REGION.**

WOLLASTONITE. *Tabular Spar.* $Ca O. Si O_2$.

Crystals tabular or prismatic. Massive and cleavable, reticulated fibrous, compact. Color white or gray tinged with brown, yellow, red. Lustre vitreous to pearly. Hardness, 4.5-5. Specific Gravity, 2.8-2.9. Streak white. Brittle.

GILLESPIE COUNTY. C.

WOOD OPAL. *See Opal.*

WULFENITE. *Lead Molybdate.* $Pb Mo O_4$.

Crystals square tabular; may be very thin; also octahedral and prismatic. Occurs also in granular massive form, either coarse or fine. In color yellow, greenish, grayish, white, orange, red. Streak white. Specific Gravity, 6.7-7. Hardness, 2.75-3.

EL PASO COUNTY:

Quitman Mountains. C.
Garlin Mine. C.

TRANS-PECOS REGION.**

YTTRIALITE. *Yttrium-Thorium Silicate.*

"The mineral which we have named *Yttrialite* was discovered associated with, and often upon, the gadolinite, and but for its characteristic orange-yellow surface alteration (that of gadolinite immediately alongside of it being invariably of a dull brick-red color) it might have continued to pass for 'green-gadolinite,' which was the local name given to it. Of these yellowish masses one weighed over ten pounds, and twenty kilos were found in all. Upon being broken open they are of an olive-green color, tending in places to a drab shade. Peculiar minute ragged lines permeate the mineral in all directions, causing an apparent muddiness or semi-opacity. No crystals have as yet been observed, but a seem-

ingly ortho-rhombic symmetry was apparent in some of these masses. The mineral breaks easily in two directions with a shell-like fracture, but separates into small flakes very readily. (Gadolinite is broken only with difficulty.) Nothing like a cleavage has been noticed. A thin white crust of a mineral related to tengerite occupies the cracks in the mineral, and this is equally true concerning the gadolinite of the locality, as Genth has already noted. We have named the mineral *yttrialite*, in allusion to the prominent part played by the yttria earths in its composition.

"The specific gravity is 4.575; hardness=5-5.5. It is readily soluble in hydrochloric acid. When heated over the Bunsen flame it decrepitates violently, and falls to powder upon being ignited over a blast, becoming snuff-brown, infusible and insoluble. These characteristics serve to at once distinguish it from gadolinite, which has specific gravity from 4.2 to 4.3 (Texas varieties), and which, when heated, glows vividly and swells into ragged fragments. The analysis shows several fractions of the yttria earths (A, B, C, D), which were separated by successive precipitations with sodium sulphate. The atomic weight of each fraction was determined, showing successive increase with each separation. The fractionation was discontinued after the fourth separation, as the amount of material was getting very small, but the atomic weight shows that the lanthanum and didymium are still mixed with an earth of higher atomic weight.

"The results obtained are as follows:

		Oxygen ratio.	
Si O ₂	29.17%		97.234=4
Pb O.....	0.854	0.383	}
Th O ₂	12.00	9.108

A SUMMARY OF THE MINERALS OF TEXAS BY COUNTIES.

ANDERSON COUNTY:
Asphaltum; Calcite; Chalcocite; Lignite; Limonite; Petroleum; Pottery Clay; Pyrite; Rock Salt; Topaz (transported).

ANGELINA COUNTY:
Natural Gas; Lignite.

ARCHER COUNTY:
Chalcocite; Coal; Malachite.

ARMSTRONG COUNTY:
Gypsum.

ATASCOSA COUNTY:
Natural Gas; Lignite.

AUSTIN COUNTY:
Pottery Clay.

BASTROP COUNTY:
Brick Clay; Gypsum; Lignite; Melanterite; Yellow Ochre; Petroleum; Pottery Clay; Pyrite.

BAYLOR COUNTY:
Permian Copper Ore.

BELL COUNTY:
Petroleum; Pottery Clay.

BEXAR COUNTY:
Bat Guano; Brick Clay or Earth; Natural Gas; Lignite; Petroleum; Pottery Clay.

BLANCO COUNTY:
Bat Guano.

BOSQUE COUNTY:
Meteoric Iron.

BOWIE COUNTY:
Brick Clay or Earth; Lignite; Pearls; Pottery Clay.

BRAZORIA COUNTY:
Brick Clay; Natural Gas; Gypsum; Petroleum; Pottery Clay; Rock Salt; Sulphur.

BRAZOS COUNTY:
Brick Clay or Earth; Lignite.

BREWSTER COUNTY:
Agate; Aragonite; Asphaltum; Calcite; Calomel; Cerargyrite; Cinnabar; Coal; Fluorite; Graphite; Gypsum; Jasper; Mercury; Metacinnabarite; Petroleum; Pyrolusite; Terlinguaite.

BROWN COUNTY:

Coal; Epsomite; Natural Gas; Petroleum.

BURLESON COUNTY:

Lignite; Petroleum; Pottery Clay; Pyrite; Sulphur.

BURNET COUNTY:

Actionolite; Agate, Albite; Almandite; Amethyst; Amphibole; Ankerite; Apatite; Asphaltum; Azurite; Bat Guano; Beauxite; Biotite; Bronzite; Calcite; Cassiterite; Celestite; Chalcopyrite; Chert; Cuprite; Enstatite; Epidote; Fassaite; Ferrocaltite; Fibrolite; Galena; Grossularite; Hematite; Hypersthene; Kaolite; Labradorite; Limonite; Lithomarge; Magnetite; Malachite; Molybdenite; Oligoclase; Orthoclase; Pyrite; Pyrolusite; Pyroxene; Quartz; Tourmaline; Travertine; Vesuvianite.

CALDWELL COUNTY:

Brick Clay or Earth; Lignite; Limonite; Petroleum.

CAMERON COUNTY:

Pottery Clay.

CAMP COUNTY:

Lignite; Limonite; Pottery Clay.

CASS COUNTY:

Lignite; Limonite; Pottery Clay.

CHEROKEE COUNTY:

Brick Clay or Earth; Lignite; Limonite; Red Ochre.

CLAY COUNTY:

Petroleum.

COLEMAN COUNTY:

Coal; Natural Gas; Petroleum.

COLLIN COUNTY:

Pottery Clay.

COLORADO COUNTY:

Natural Gas; Pottery Clay.

COMAL COUNTY:

Bat Guano.

COMANCHE COUNTY:

Flint.

COOKE COUNTY:

Asphaltum; Natural Gas; Petroleum; Pottery Clay.

CORYELL COUNTY:

Melanterite; Petroleum.

DALLAS COUNTY:

Brick Clay or Earth; Pottery Clay.

DELTA COUNTY:

Pottery Clay.

DENTON COUNTY:

Meteoric Iron; Petroleum reported; Pottery Clay.

DEWITT COUNTY:

Pottery Clay.

DIMMIT COUNTY:

Lignite.

DUVAL COUNTY:

Natural Gas; Petroleum.

EASTLAND COUNTY:

Coal.

EDWARDS COUNTY:

Bat Guano; Kaolinite; Petroleum; Sulphur.

ELLIS COUNTY:

Pottery Clay.

EL PASO COUNTY:

TRANS. PECOS REGION:

Agate, Banded; Agate, Cloudy; Agate, Moss; Alabaster; Alum; Amethyst; Antimony; Aragonite; Argentite; Asphaltum; Atacamite; Aventurine; Azurite; Bornite; Brick Clay or Earth; Bromyrite; Calamine; Calcite; Calomel; Cassiterite; Cerargyrite; Cerussite; Chalcedony; Chalcocite; Chalcopyrite; Christophyte; Chrysocolla; Cinnabar; Copper, Native; Crednerite; Cuprite; Cupro-Desclousite; Cyanotrichite; Dihydrite; Dolomite; Ehlite; Epidote; Flint; Fluorite; Franklinite; Galena; Gas, Natural; Glauconite; Goethite; Gold; Graphite; Grossularite; Gypsum; Hematite; Jasper; Lampadite; Limonite; Magnetite; Malachite; Massicot; Melanconite; Mercury; Metacinnabarite; Microcline; Nickel; Nitre; Onyx; Opal; Petroleum; Platinum, traces; Pitchblende (Uranpecherz); Pribramite; Pseudomalachite; Psilomelane; Pyrite; Pyrolusite; Quartz (Agate, Amethyst, Flinty, Granular, Milky, Smoky); Salt; Sagenitic Quartz; Sardonyx; Serpentine; Siderite; Silver, Native; Sphalerite; Stromeyerite; Sulphur; Talc; Terlinguaite; Tetrahydrite; Titaniferous Ores; Torbernite; Tourmaline; Turquoise; Uranium; Uranochre; Wad; Wolframite; Wulfenite.

THE SCALE OF HARDNESS.

The scale of hardness in common use covers ten pounds, as represented by the hardness of the following minerals:

1. Talc.
2. Gypsum.
3. Calcite.
4. Fluorite.
5. Apatite.
6. Orthoclase.

7. Quartz.
8. Topaz.
9. Corundum.
10. Diamond.

As a substitute for this use may be often made of the following scale taken from Crosby although the degree of accuracy is much diminished:

"1. Very soft (below 2.5); can be scratched with the nail, or very easily with the knife.

"2. Soft (2.5-4); cannot be scratched with the nail, but easily scratched with the knife.

"3. Hard (4-6); can be scratched with the knife, but not easily.

"4. Very hard (6-7); cannot be scratched distinctly with the knife, but is scratched by quartz.

"5. Adamantine (above 7); cannot be scratched by quartz.

"The figures in the parentheses give the corresponding degrees of the regular scale."

SPECIFIC GRAVITY.

The specific gravity of a mineral is a comparison of its weight with that of an equal bulk of water.

Weigh the specimen as accurately as possible on a balance; then suspend it by means of a thread from one pan of the balance, completely immerse it in water, and weigh again. Subtract the weight while immersed in water from its weight in air and the difference is the weight of an equal bulk of water. Divide the weight in air by this difference and the result is the specific gravity sought.

NOTE.—The result obtained by the above method is approximate; the professional mineralogist and chemist while employing the same plan will perform the operation with a greater degree of refinement with reference to the weighing, and the purity and temperature of the water.

STREAK.

The streak of a mineral is the color of its powder. It may be seen (if the specimen is not too hard) by scratching its surface with a knife or rubbing it on a piece of unglazed porcelain or ground glass.

LUSTRE.

1. *Metallic* as seen on metallic surfaces.
2. *Adamantine* like that of the diamond.
3. *Vitreous* as in the case of broken glass.
4. *Resinous* as the surface of yellow resins.
5. *Greasy* as oily glass.
6. *Pearly*.
7. *Silky*.

FRACTURE.

1. *Conchoidal*; breaking with curved concavities, shell-like.
2. *Even*; the broken surface, while not necessarily smooth, that of a plane.
3. *Uneven*; surface irregular.
4. *Hackly*; surface rough and jagged.

THE COMMERCIAL ASPECTS OF CERTAIN ORES IN TRANS-PECOS, TEXAS.

WM. B. PHILLIPS, DIRECTOR OF THE SURVEY.

In the preceding pages Dr. Simonds has given as complete a list of the Minerals and Mineral Localities of Texas as can now be prepared. He has been engaged upon this work for some time and has drawn upon all possible sources of information, with the result that this Survey can now offer to the citizens of this State, and others interested in the subject, an authoritative statement.

Supplementary to the report there can be given some analyses and assays of useful minerals made by Messrs. O. H. Palm and S. H. Worrell in the laboratory of the Survey during the last eighteen months. In part these relate to material collected by the former Geological Survey and deposited in the museum. A great many specimens of ores from the Trans-Pecos region were secured by W. H. von Streeruwitz ten or eleven years ago, but they do not seem to have been examined with reference to their commercial value. In re-arranging this material it was decided to assay the specimens representing the ores of gold, silver, copper, lead and zinc. This task was undertaken in such a manner as not to interfere with the regular chemical work and it is believed that the results are of sufficient importance to warrant some discussion. From El Paso county there were examined 51 specimens for gold and silver alone; 33 for gold, silver and lead, 83 for gold, silver and copper; 5 for gold, silver, copper and lead, and 9 for gold, silver, copper, lead and zinc; total number examined, 181. From Presidio county there were examined 3 for gold and silver alone; 6 for gold, silver and lead; 5 for gold, silver, copper and lead, and one for gold, silver, copper, lead and zinc; total number examined, 15. From the counties of El Paso and Presidio there were thus examined 196 specimens, of which 54 were for gold and silver alone; 39 for gold, silver and lead; 10 for gold, silver, copper and lead; 10 for gold, silver, copper, lead and zinc, and 83 for gold, silver and copper.

In every case an assay for gold and silver was made, with the result that in 143 samples gold was not found at all, in 35 samples there was a tract, and in 18 samples it varied from 0.05 oz. (\$1.00 per ton) as in a gold-silver-lead ore from the Carrizo Mountains, El Paso County, to 2.0 ozs. (\$41.34 per ton) as in a sample from the Presidio mine, Presidio County. In 106 samples no silver was found; in 5 samples there was a trace; in 85 samples it varied from 0.2 oz. to 4,089 ozs., as in a sample from the Presidio mine, Presidio county. It does not appear to be necessary to make any further mention of the specimens that contained neither gold nor silver, nor those that contained less than $\frac{1}{4}$ oz. gold and 6 ozs. silver, but it would be well to consider each county separately and to give tables setting forth the results of the assays of specimens that contained both gold and silver and those that contained silver.

Such tables for El Paso county now follow:

EL PASO COUNTY.*Gold and Silver Ores.*

Containing as much as $\frac{1}{2}$ oz. gold and 6 ozs. of silver per ton, or $\frac{1}{2}$ oz. gold with less than 6 ozs. of silver; values taken at \$20.67 per oz. for gold and 50 cts. for silver.

Locality.	Assay No.	Ounces per ton.		Value per ton.		
		Gold.	Silver.	Gold.	Silver.	Total.
Quitman Mountains.....	1669	0.50	6.00	\$ 10.33	\$ 3.00	\$ 13.33
Quitman Mountains.....	1670	0.25	19.00	5.16	9.50	14.66
Quitman Mountains.....	1672	0.70	19.30	14.46	9.65	24.11

¹Contains also 0.5 oz. gold. ²Contains also 15 per cent. zinc. ³Contains also 1.4 ozs. gold.

A sample from the Don Quixote mine, Sierra Diablo, El Paso county, gave 24.2 per cent of copper, but no gold or silver, assay No. 1812; a sample from the Black Shaft, Sierra Diablo, gave 45 ozs. of silver per ton and 5.5 per cent of copper, with no lead or zinc, assay No. 1192; a sample from the Nameless Shaft, Sierra Diablo, gave 311 ozs. of silver per ton and 4.1 per cent of copper. The Hazel mine, in the foothills of the Sierra Diablo, north of Van Horn, El Paso county, has yielded beautiful specimens of native silver, besides silver chlorides, copper sulphides and native copper. W. H. von Streeruwitz (Geol. Survey of Texas, Third Annual Report for 1891, pp. 387-389) gave the following description of the Hazel mine.

"This mine is owned by Messrs. Shriver and Andrews, San Antonio, and is located about ten miles north of Allamore Station on the Texas & Pacific Railway. The gangue is nearly perpendicular. Its width to a depth of about five hundred feet averages thirty-four feet, below this depth it widens to over forty feet. Its longitudinal extension may be traced for several miles, and its nearly uniform thickness is ascertained for 1800 feet by the present workings. The gangue is in a fissure between a fine grained sandstone of probable Devonian age, which also forms the walls, and which, in the vicinity of the gangue, is more or less metalliferous. The gangue has a whitish gray colored calcareous silicate, more or less impregnated through nearly its whole width with copper and silver sulphide and other metal combinations, and numerous richer veinlets fill the space between the two principal veins known as the north and south veins.

"The north vein runs from the outcrop to the whole depth reached at the time of the examination (June, 1891), down to 575 feet, practically perpendicular. The south vein runs also perpendicular to about 150 feet, when it changes its dip slightly to the north and joins the north vein at about 455 feet from the surface. At about 350 feet from the surface another vein was struck on the south side, which joins the north vein at about 500 feet. A vein running in at 360 feet through the south wall dips nearly parallel with the north vein to the full depth of the shaft, thus forming the south vein in the deeper parts of the vein. The strike of the gangue and the veins is nearly true east and west.

"The east shaft, on which most of the work has been done, is sunk on the south vein, reaching (June, 1891) the depth of 575 feet. From this shaft every 50 feet cross-cuts are made to the north vein, determining the average width of the gangue from wall to wall to be about 35 feet. From these cross-cuts, as well as directly from the shaft, more or less extensive drifts are run in the north and south veins, and the quantity and quality of ore struck by shafting and drifting in the veins and pockets is highly promising to actual mining by stoping. The west shaft is sunk on the north vein 1800 feet west of the east shaft to a depth of 375 feet and about 350 feet of cross-cuts and drifts have been worked from this shaft. The middle shaft is 300 feet west from the east shaft, on the north vein. It is 42 feet deep, and there was a drift of about 40 feet in a material of the same character as the east shaft. The walls, as well as the gangue material in all the shafts and drifts, are sound and solid, and very little timbering is required. * * *

"The principal ores of the main veins, as well as the veinlets and pockets, are silver-bearing copper glance, gray copper, silver copper

glance, silver glance, native silver, and chlorides with more or less copper. Lead, antimony and arsenic compounds are found in traces, and traces of gold are not infrequent. Certain strongly ferruginous specimens assayed 0.95 oz. of gold and 13 ozs. of silver per ton. The gray copper yields very high assays, up to 2000 ozs. of silver, and assays of some of the copper glance exceed 600 ozs. of silver per ton. These, as well as the other combinations mentioned above, are deposited through the vein material (lime silicates, frequently with heavy spar), widening out occasionally to pockets of considerable size. The whole gangue between the east and west shaft may be regarded as filled in with low grade ore through which the richer veins, pockets and veinlets are dispersed.

* * *

"The red sandstone, in which the gangue runs to the depth of 575 feet, will probably change into a crystalline schist or granitic rock at greater depth, and this change will in all probability favorably influence the ore-bearing."

The Hazel mine is thought to have yielded about \$60,000 worth of ore before it was closed down. It is one of the most promising silver-copper properties in the State, in spite of the fact that no work has been carried on there for several years.

Mr. von Streeruwitz says that some samples of the gray copper carried up to 2000 ozs. of silver and the copper glance above 600 ozs. While we have made no assays of ore of this character we did assay 7 samples from the old collections.

Hazel Mine Ore.

1122	198.71	4.4
1653	3.60	none
1781	77.00	43.0
1804	29.00	19.9
1810	60.00	44.2
1844	371.60	24.3
1862	9.20	12.0

Last winter Mr. Thomas Owen, Van Horn, El Paso county, sent in some excellent copper ores from the district immediately adjoining the Hazel mine. The analyses of the samples sent were as follows:

Assay No.	Sample o.	Gold. Ozs. per ton.	Silver. Ozs. per ton.	Copper. Per cent.	Lead Per cent.
1442.....	1	none	2.3	12.7	
1443.....	2	none	2.5	5.0	13.0
1444.....	3	none	none	76.1	8.8
1445.....	4	none	none	55.6	6.8
1446.....	5	none	none	60.9	11.5

NOTE: In assay No. 1442, sample No. 1, nearly all the copper was metallic, the remainder being red and black oxide.

Mr. B. F. Hill, Assistant Geologist on this Survey, made a special

trip into the district in February, of this year, and his report is as follows:

"In the spring of the present year some rich samples of copper ore were received at the laboratory of the Survey from Mr. T. R. Owen, Van Horn. These samples were from prospects being worked by him at the time, on Block 54, public school lands, El Paso county. In February a visit was made to the locality. The prospects are located about 18 miles north of Van Horn, a station on the Texas & Pacific Railroad. The wagon road leading to the locality is fairly good, passing through the gap between the main Diablo range and the Baylor Mountains, at the mouth of Sulphur Canyon. The prospects themselves are located in the foothills of the Diablos about one-half mile from the eastern scarp, which at this point is an almost vertical bluff about 1800 feet in height. The bluffs are of heavily bedded upper Carboniferous limestones, which lie almost horizontally upon the dark red sandstone that contains the ore deposits. The sandstone has been extensively altered and shows little evidence of bedding at the present time. Instead a species of slaty structure is visible in a great many places. There are a few fault displacements visible in the thickly bedded limestone, one overthrust fault with about 100 feet of displacement being conspicuous. The limestones are apparently unconformable upon the sandstone, whose thickness at this locality cannot be estimated, although as much as 1000 feet is exposed in bluffs on the south side of Sulphur Canyon.

The Pecos Mining Company of Pecos, Texas, composed of Messrs. Owen, Briggs and Kranskoff, has located seven claims along an altered belt in the sandstone. These claims, the Zada May, Merl, Congress, Sovereign, Silver Bean No. 1, Silver Bean No. 2, and Shorty, extend about one mile north and south and one-half mile east and west. They are located upon a "vein" in the sandstone which is indicated by a streak of yellow discoloration ranging in width from two to twenty feet. There are no distinct walls to the vein, the yellow colored sandstone passing gradually into the normal red colored variety. Within this belt there appear at intervals stringers and streaks of the ores of copper, silver and lead.

Shallow excavations have been made along the vein at intervals and at one locality a shaft was being sunk, which at that time had reached a depth of 45 feet. It was from the shaft that the samples sent to the laboratory of the Mineral Survey were obtained. At the depth of 45 feet the pay ore is found in a very narrow veinlet and consists of black oxide of copper with some sulphide.

On the dump are samples which show good values in native copper, malachite and azurite. I was informed that a considerable body of rich oxidized ore was found near the surface. A shipment of ore had been made to the El Paso smelter, but the returns were not available. Samples selected by Mr. Owen and represented as being fair samples of the pay streaks assayed as above.

Toward the southern end of the claim the surface workings show seams of the carbonates of copper and in one locality considerable lead carbonate.

West of Van Horn the cuts along the railroad show an extensive series of schists, crystalline limestones, slates and quartzites. These rocks have been badly broken and faulted and are cut in various directions by igneous intrusions and quartz veins, some of the latter being of great

width. Many minor veins with quartz and iron gangue carry small amounts of lead, copper and silver, and in some instances gold. There are numerous abandoned prospects whose name or history could not be learned, nearly all of which show some ore on the dumps. In this general district one mine yielded considerable lead, silver and copper. Reference is made to the Hazel mine, which lies 12 miles north of Allamore. At present the mine is not being worked, but it is reported that work will be resumed shortly. The veins carrying the values cut the red sandstone in identically the same way as do the veins spoken of on Owen's prospects. On the dump are considerable quantities of low grade material that may in the future prove valuable.

As far as could be learned from the examination the sandstone rests unconformably on the series of slates, limestones, and quartzites. Only a detailed study can clear up the true structure of the county which on the whole seems to be of some promise as a mineral belt."

The Sierra Diablo, the Quitman Mts., the Carrizo Mts. and the Franklin Mts., all in El Paso county, are certainly worthy of a more detailed study than has yet been given to them, and it is proposed to send a special party there next season. From an economic standpoint the investigations of W. H. von Streeruwitz, in 1891, are about the only sources of information respecting these areas. What is now needed is a more detailed study of the geology of the region with special reference to ore deposits, together with a study of water supply. The country is arid, but it would appear to be entirely feasible to construct storage reservoirs for impounding and holding the rain water during the dry season. The underground waters of the region should also be a subject of special study, and this could be undertaken in co-operation with the Hydrographic Bureau of the United States Geological Survey. The topographic maps of the United States Geological Survey cover the following areas in El Paso county, viz.: N. W. Angle of Valentine sheet. N. E. Part Chispa sheet. Eagle Mountain sheet. Sierra Blanca sheet. Salt Basin sheet and the sheet west of Salt Basin; Fort Hancock sheet. Rio Grande sheet and El Paso sheet. Four other sheets should be added, viz., the four north of the Chispa and the Valentine sheets and east of the Sierra Blanca and Salt Basin sheets. With the completion of these four sheets the entire mineral area of El Paso county would be covered by these excellent maps. The detailed examination of such a region with respect to its economic geology becomes much more satisfactory if undertaken *after* the topographic maps have been prepared, and it is hoped that we may be able to undertake this important work in co-operation with the Federal Government next year. The area still to be mapped in El Paso county embraces the deposits of sulphur in the northeastern part of the county, which were particularly described in Bulletin No. 2 of this Survey, issued in February, 1902. A more extended examination of these deposits is among the plans of the Survey for next year.

With respect to tin: It has been known for several years that tin ore was found in the Franklin Mountains, about 10 miles north of the city of El Paso. The deposits have been described by W. H. Weed, in Bulletin No. 178, United States Geological Survey, and what is now given concerning them is taken from this report, January, 1901.

The deposits of El Paso county lie on the east flank of the Franklin

Mountains, which are composed of Cambrian and other Paleozoic limestones. These limestones have been upturned and now rest upon an intrusive mass of coarse-grained granite which is the central core of the range. This granite appears to have been intruded between the base of the Cambrian and the underlying Archean complex, for basal quartzites occur in the drift along the arroyos. Mr. Lindgren examined the granite (sheeted near the tin veins) and reported that it was a coarse-grained normal granite, showing much anhedral quartz with anhedral feldspar, largely micropertite, with some few grains of microcline. A few small flakes of brownish-green hornblende and some small grains of magnetite were also observed. The rock is a soda-granite. White ap-lite-granite occurs in veinlets and irregular masses intrusive in the granite, but none was observed near the tin veins.

The tin ore is cassiterite (oxide of tin), with wolframite (a compound of tungstic acid, iron and manganese) in a quartz gangue, and occurs as a granular mixture of tin ore and quartz and resembles the greisen of the European tin deposits. This greisen is a quartz-cassiterite rock. It is coarsely granular and consists of anhedral quartz (quartz without visible crystal-planes) with which there are mixed slightly brownish grains of cassiterite. The quartz contains fluid inclusions. Mr. Weed took no samples, so that no assays are given in his report. Some shallow shafts had been sunk and a few cross-cuts run, but the development work was not of an extensive character. Assays of selected samples of the rich ore gave, in the laboratory of this Survey, as much as 42 per cent. of tin, but the average will be much below this. If, on the average, the ore should be found to carry 3 per cent. of tin and if it exists in sufficient quantity this property would be extremely valuable. It belongs to Mr. C. R. Moorhead, El Paso. It is our purpose to make a detailed examination of the locality next season. The United States does not produce any tin, the supply coming from Cornwall, the Straits Settlements (Banca), Borneo, etc.

ORES FROM PRESIDIO COUNTY.

From Presidio county there were examined three samples for gold and silver alone. Two of these were marked "Cibolo Mine," and one "Presidio Mine." Of the two from the Cibolo mine one contained neither gold nor silver, the other contained a trace of gold and 435.3 ozs. of silver per ton, assay No. 1654. The sample from the Presidio mine gave no gold but yielded 131.45 ozs. of silver per ton, assay No. 1655.

Six samples were assayed for gold, silver and lead. The results were as follows:

Ores from Presidio County.

Locality.	Assay No.	Gold. Ozs. per ton.	Silver.Ozs. per ton.	Lead. Per cent.
Shafter Mine.....	1185	none	60.00	5.5
Presidio Mine.....	1737	0.3	4.5	trace
Presidio Mine.....	1738	none	24.6	74.0
Presidio Mine.....	1739	none	2.8	14.0
Mexican House.	1740	none	120.9	trace
Chinati Mountains.....	1741	trace	8.25	37.5

Five samples were examined for gold, silver, copper and lead with the following results:

Ores from Presidio County.

Locality.	Assay No.	Gold. Ozs. per ton.	Silver.Ozs. per ton.	Copper. Per cent.	Lead. Per cent.
Cibolo Mine.....	1127	none	56.21	trace	trace
Presidio Mine.....	1130	none	177.8	none	none
Presidio Mine.....	1131	2.0	4,089.0	3.0	none
Presidio Mine.....	1132	trace	2,892.0	trace	trace
Spanish Mine.....	1134	none	20.7	none	trace

The sample represented by assay No. 1131 carrying 2 ozs. of gold and 4,089 ozs. of silver with 3 per cent of copper, is the richest specimen of ore from Texas that we have examined. Assay No. 1132 also represents an excellent silver ore, although it carried no gold or copper.

One sample of zinc blende, marked "Shafter Mine," contained a trace of gold and lead, no copper, 1.4 ozs. of silver per ton and 44 per cent of zinc.

The only continuously successful silver mine in Texas is at Shafter, Presidio county, 47 miles west of south from Marfa. It has been in active operation for 15 or 16 years and is credited with nearly \$7,000,000 worth of silver. Its affairs have been conducted quietly and no stock is offered for sale. The Cibolo and the Presidio mines are included in the property. The assays given represent picked specimens and the average content of silver is by no means so high. The ore is held in limestone and is a free-milling quartz. The mill has 15 stamps and wet crushing and amalgamation is the process used for the extraction of the silver. There is but little galena and when found it is in pockets.

The silver mines at Shafter are the only mines now in operation in Presidio county or that have been so for several years. We can not enter upon a discussion of the question why the other properties in that county are not worked. Some of them are certainly of as good promise as the Shafter mines were when they were opened, and of one or two it may be said that they are of better promise than these were. The same is true of some properties in El Paso county.

Ten years ago W. H. von Streeruwitz called attention to the lack of systematic and competent prospecting, but there has been little or no development since. In the whole of the Trans-Pecos region the only mining operations that need be considered are at the silver mines near Shafter, Presidio county, and at the quicksilver mines, near Terlingua, Brewster county. These latter have been so fully described by B. F. Hill, in Bulletin No. 4 of the University of Texas Mineral Survey, October, 1902, that nothing further can now be said.

There are no mines of copper, or lead, or zinc, in operation in the Trans-Pecos.

ANNOUNCEMENT.

The Chemical Laboratory of the University of Texas Mineral Survey is fully equipped for all kinds of analytical work, assaying, etc. Prompt attention will be given to all such business.

Address

DR. WM. B. PHILLIPS,
Director.
